1 FIELD OF THE INVENTION

2 The invention relates generally to non-naturally occurring novel proteins which
3 have insecticidal properties, and more specifically to the design, preparation, and use of
4 proteins that have been deallergenized while maintaining their insecticidal properties.
5 Deallergenized patatin proteins include variants that have had allergenic sequences
6 modified, and permuteins that have had their amino acid sequences rearranged at one or
7 more breakpoints.

8 BACKGROUND OF THE INVENTION

9 Insecticidal proteins

10 The use of natural products, including proteins, is a well known method of
11 controlling many insect, fungal, viral, bacterial, and nematode pathogens. For example,
12 endotoxins of *Bacillus thuringiensis* (*B.t.*) are used to control both lepidopteran and
13 coleopteran insect pests. Genes producing these endotoxins have been introduced into
14 and expressed by various plants, including cotton, tobacco, and tomato. There are,
15 however, several economically important insect pests such as boll weevil (BWV),
16 *Anthonomus grandis*, and corn rootworm (CRW), *Diabrotica* spp. that are not as
17 susceptible to *B.t.* endotoxins as are insects such as lepidopterans. In addition, having
18 other, different gene products for control of insects which are susceptible to *B.t.*
19 endotoxins is important, if not vital, for resistance management.

20 It has been recently discovered that the major storage protein of potato tubers,
21 patatins (Gaillard, T., *Biochem. J.* 121: 379-390, 1971; Racusen, D., *Can. J. Bot.*, 62:
22 1640-1644, 1984; Andrews, D.L., *et al.*, *Biochem. J.*, 252: 199-206, 1988), will control
23 various insects, including western rootworm (WCRW, *Diabrotica virgifera*), southern
24 corn rootworm (SCRW, *Diabrotica undecimpunctata*), and boll weevil (BWV,
25 *Anthonomus grandis*) (U.S. Patent No. 5,743,477). Patatins are lethal to some larvae and
26 will stunt the growth of survivors so that maturation is prevented or severely delayed,
27 resulting in no reproduction. These proteins, have nonspecific lipid acyl hydrolase
28 activity and studies have shown that the enzyme activity is essential for its insecticidal

1 activity (Strickland, J.A., *et al.*, *Plant Physiol.*, 109: 667-674, 1995; U.S. Patent No.
2 5,743,477). Patatins can be applied directly to the plants or introduced in other ways well
3 known in the art, such as through the application of plant-colonizing microorganisms,
4 which have been transformed to produce the enzymes, or by the plants themselves after
5 similar transformation.

6 In potato, the patatins are found predominantly in tubers, but also at much lower
7 levels in other plant organs (Hofgen, R. and Willmitzer, L., *Plant Science*, 66: 221-230,
8 1990). Genes that encode patatins have been previously isolated by Mignery, G.A., *et al.*
9 (*Nucleic Acids Research*, 12: 7987-8000, 1984; Mignery, G.A., *et al.*, *Gene*, 62: 27-44,
10 1988; Stiekema, *et al.*, *Plant Mol. Biol.*, 11: 255-269, 1988) and others. Patatins are
11 found in other plants, particularly solanaceous species (Ganal, *et al.*, *Mol. Gen. Genetics*,
12 225: 501-509, 1991; Vancanneyt, *et al.*, *Plant Cell*, 1: 533-540, 1989) and recently *Zea*
13 *mays* (WO 96/37615). Rosahl, *et al.* (*EMBO J.*, 6: 1155-1159, 1987) transferred it to
14 tobacco plants, and observed expression of patatin, demonstrating that the patatin genes
15 can be heterologously expressed by plants.

16 Patatin is an attractive for use in planta as an insect control agent, but
17 unfortunately a small segment of the population displays allergic reactions to patatin
18 proteins, and in particular to potato patatin, as described below.

19 Food allergens

20 There are a variety of proteins that cause allergic reactions. Proteins that have
21 been identified as causing an allergic reaction in hypersensitive patients occur in many
22 plant and animal derived foods, pollens, fungal spores, insect venoms, insect feces, and
23 animal dander and urine (King, H.C., *Ear Nose Throat J.*, 73(4): 237-241, 1994 ;
24 Astwood, J.D., *et al.*, *Clin. Exp. Allergy*, 25: 66-72, 1995; Astwood, J.D. and Fuchs R.L.,
25 *Monographs in allergy Vol. 32: Highlights in food allergy*, pp. 105-120, 1996; Metcalfe,
26 D.D., *et al.*, *Critical Reviews in Food Science and Nutrition*, 36S: 165-186, 1996). The
27 offending proteins of many major sources of allergens have been characterized by clinical
28 and molecular methods. The functions of allergenic proteins *in vivo* are diverse, ranging
29 from enzymes to regulators of the cell cytoskeleton.

To understand the molecular basis of allergic disease, the important IgE binding epitopes of many allergen proteins have been mapped (Elsayed, S. and Apold, J., *Allergy* 38(7): 449-459, 1983; Elsayed, S. *et al.*, *Scand J. Clin. Lab. Invest. Suppl.* 204: 17-31 1991; Zhang, L., *et al.*, *Mol. Immunol.* 29(11): 1383-1389, 1992). The optimal peptide length for IgE binding has been reported to be between 8 and 12 amino acids. Conservation of epitope sequences is observed in homologous allergens of disparate species (Astwood, J.D., *et al.*, *Clin. Exp. Allergy*, 25: 66-72, 1995). Indeed, conservative substitutions introduced by site-directed mutagenesis reduce IgE binding of known epitopes when presented as peptides.

Food allergy occurs in 2-6 % of the population. Eight foods or food groups (milk, eggs, fish, crustacea, wheat, peanuts, soybeans, and tree nuts) account for 90% of allergies to foods. Nevertheless, over 160 different foods have been reported to cause adverse reactions, including potato (Hefle, S., *et al.*, *Crit. Rev. in Food Sci. Nutr.*, 36S: 69-90, 1996).

Mode of action of allergens

Regardless of the identity of the allergen, it is theorized that the underlying mechanism of allergen response is the same. Immediate hypersensitivity (or anaphylactic response) is a form of allergic reaction which develops very quickly, i.e., within seconds or minutes of exposure of the patient to the causative allergen, and is mediated by B lymphocyte IgE antibody production. Allergic patients exhibit elevated levels of IgE, mediating hypersensitivity by priming mast cells which are abundant in the skin, lymphoid organs, in the membranes of the eye, nose and mouth, and in the respiratory tree and intestines. The IgE in allergy-suffering patients becomes bound to the IgE receptors of mast cells. When this bound IgE is subsequently contacted by the appropriate allergen, the mast cell is caused to degranulate and release various substances such as histamine into the surrounding tissue (Church *et al.* In: Kay, A.B. ed., *Allergy and Allergic Diseases*, Oxford, Blackwell Science, pp. 149-197, 1997).

It is the release of these substances which is responsible for the clinical symptoms typical of immediate hypersensitivity, namely contraction of smooth muscle in the airways or in the intestine, the dilation of small blood vessels, and the increase in their

permeability to water and plasma proteins, the secretion of thick sticky mucus, and (in the skin) the stimulation of nerve endings that result in itching or pain. Immediate hypersensitivity is, at best, a nuisance to the sufferer; at worst it can present very serious problems and can in rare cases even result in death.

Allergic reactions to potato

Food allergy to potato is considered rare in the general population (Castells, M.C., *et al.*, *Allergy Clin. Immunol.*, 8: 1110-1114, 1986; Hannuksela, M., *et al.*, *Contact Dermatitis*, 3: 79-84, 1977; Golbert, T.M., *et al.*, *Journal of Allergy*, 44: 96-107, 1969). Approximately 200 individuals have participated in published clinical accounts of potato allergy (Hefle, S. *et al.*, *Critical Reviews in Food Science and Nutrition*, 36S: 69-90, 1996). A number of IgE binding proteins have been identified in potato tuber extracts (see Table 1), however the amino acid sequence and function of these proteins has not been determined (Wahl, R., *et al.*, *Intl. Arch. Allergy Appl. Immunol.*, 92: 168-174, 1990).

Table 1: Studies of potato tuber IgE-binding proteins (allergens)

| Study | Protein Characteristics |
|--|----------------------------|
| (Castells, M.C. <i>et al.</i> <i>J. Allergy Clin. Immunol.</i> 78, 1110-1114, 1986) | Unknown 14 to 40 kDa |
| (Wahl, R. <i>et al.</i> <i>Intl. Arch. Allergy Appl. Immunol.</i> 92: 168-174, 1990) | Unknown 42/43 kDa |
| | Unknown 65 kDa |
| | Unknown 26 kDa |
| | Unknown 20 kDa |
| | Unknown 14 kDa |
| | Unknown < 14 kDa (~ 5 kDa) |
| (Ebner, C. <i>et al.</i> in: Wuthrich, B. & Ortolani, C. (eds.), <i>Highlights in food allergy. Monographs in Allergy, Volume 32</i> Basil, Karger, pp. 73-77, 1996) | Unknown 42/43 kDa |
| | Unknown 23 kDa |
| | Unknown ~ 16 kDa |
| | Unknown < 14 kDa (~ 5 kDa) |

Improved safety from the use of hypoallergenic proteins

Patatin has been identified as an allergenic protein (Seppala, U. *et al.*, *J. Allergy Clin. Immunol.* 103:165-171, 1999). Accordingly, potato allergic subjects may not be

1 able to safely consume products containing unmodified patatin protein, such as crops to
2 which foliar applications of patatins have been applied, or crops which have been
3 engineered to express patatin. In addition, proliferation of food allergens in the food
4 supply is considered hazardous (Metcalf, D.D., *et al.*, *Critical Reviews and Food*
5 *Science and Nutrition*, 36S: 165-186, 1996). There are additional concerns regarding the
6 use of potentially allergenic food proteins where workers might be exposed to airborne
7 particulates, initiating a new allergic response (Moneret-Vautrin, D.A., *et al.*, *Rev. Med.*
8 *Interne.*, 17(7): 551-557, 1996).

9 Permuteins

10 Novel proteins generated by the method of sequence transposition resembles that
11 of naturally occurring pairs of proteins that are related by linear reorganization of their
12 amino acid sequences (Cunningham, *et al.* *Proc. Natl. Sci., U.S.A.*, 76: 3218-3222, 1979;
13 Teather, *et al.*, *J. Bacteriol.*, 172: 3837-3841, 1990; Schimming, *et al.*, *Eur. J. Biochem.*,
14 204: 13-19, 1992; Yamiuchi, *et al.*, *FEBS Lett.*, 260: 127-130, 1991; MacGregor, *et al.*,
15 *FEBS. Lett.*, 378: 263-266, 1996). The first *in vitro* application of sequence
16 rearrangement to proteins was described by Goldenberg and Creighton (Goldenberg and
17 Creighton, *J. Mol. Biol.*, 165: 407-413, 1983). A new N-terminus is selected at an
18 internal site (breakpoint) of the original sequence, the new sequence having the same
19 order of amino acids as the original from the breakpoint until it reaches an amino acid
20 that is at or near the original C-terminus. At this point the new sequence is joined, either
21 directly or through an additional portion or sequence (linker), to an amino acid that is at
22 or near the original N-terminus, and the new sequence continues with the same sequence
23 as the original until it reaches a point that is at or near the amino acid that was N-terminal
24 to the breakpoint site of the original sequence, this residue forming the new C-terminus
25 of the chain. This approach has been applied to proteins which range in size from 58 to
26 462 amino acids and represent a broad range of structural classes (Goldenberg and
27 Creighton, *J. Mol. Biol.*, 165: 407-413, 1983; Li and Coffino, *Mol. Cell. Biol.*, 13: 2377-
28 2383, 1993; Zhang, *et al.*, *Nature Struct. Biol.*, 1: 434-438, 1995; Buchwalder, *et al.*,
29 *Biochemistry*, 31: 1621-1630, 1994; Protasova, *et al.*, *Prot. Eng.*, 7: 1373-1377, 1995;
30 Mullins, *et al.*, *J. Am. Chem. Soc.*, 116: 5529-5533, 1994; Garrett, *et al.*, *Protein Science*,

9 There exists a need for the development of plant expressible insecticidal proteins
10 which possess minimal or no allergenic properties.

11 SUMMARY OF THE INVENTION

12 Novel protein sequences, and nucleic acid sequences encoding them are disclosed.
13 The proteins maintain desirable enzymatic and insecticidal properties while displaying
14 reduced or eliminated allergenicity.

15 Allergenic epitopes are identified by scanning overlapping peptide sequences with
16 an immunoreactivity assay. Alanine scanning and 'rational substitution' is performed on
17 identified peptide sequences to determine specific amino acids which contribute to
18 antibody binding, and presumably, to the allergenic properties of the whole protein.
19 Individual mutations are introduced into the whole protein sequence by methods such as
20 site directed mutagenesis of the encoding nucleic acid sequence to delete or modify the
21 allergenic sequences.

22 Glycosylation target residues are identified within amino acid sequences of
23 proteins which have demonstrated allergy eliciting properties. Glycosylation target
24 amino acid residues are rationally substituted with other amino acid residues to eliminate
25 glycosylation and to provide a variant deglycosylated protein. The variant protein may
26 then exhibit reduced allergen eliciting properties and may also exhibit reduced binding to
27 IgE within serum of patients observed to be allergic to said glycosylated protein.

28 Permuteins of the deallergized protein sequences can be constructed to further
29 reduce or eliminate allergic reactions. The encoding nucleic acid sequence is modified to

1 produce a non-naturally occurring protein having a linear amino acid sequence different
2 from the naturally occurring protein sequence, while maintaining enzymatic and
3 insecticidal properties. The permutein is preferably produced in plant cells, and more
4 preferably produced at a concentration which is toxic to insects ingesting the plant cells.

5 Methods for reducing, eliminating, or decreasing allergen eliciting properties of a
6 protein are specifically contemplated herein. Such methods comprise steps including
7 identifying one or more patients exhibiting an allergic sensitivity to an allergen eliciting
8 protein and obtaining a sample of serum from the patient; exposing the patient serum to a
9 first set of synthetic overlapping peptides which represent the allergen eliciting protein in
10 order to identify such peptides which exhibit epitopes which bind to IgE present within
11 the allergic patients' serum and wherein the IgE present in the serum has a specific
12 affinity for the said allergen eliciting protein; producing a second set of peptides which
13 are variant peptides based on the first set of peptides which were identified to bind
14 specifically to IgE present in patient serum, wherein the second set variant peptides
15 exhibit alanine scanning or rational scanning amino acid substitutions which exhibit
16 reduced, decreased, or eliminated IgE binding when compared to the first set non-variant
17 peptides, and wherein such substitutions which reduce, eliminate or decrease IgE binding
18 are identified as result effective substitutions; and modifying the amino acid sequence of
19 the allergen eliciting protein to contain one or more of said result effective substitutions,
20 wherein the modified protein is a variant of the allergen eliciting protein which lacks
21 allergen eliciting protein or exhibits reduced allergen eliciting properties, and wherein the
22 variant of the allergen eliciting protein comprising one or more result effective
23 substitutions exhibits reduced, decreased, or totally eliminated binding of IgE present
24 within said patients' serum.

25 The novel proteins can be used in controlling insects, as nutritional supplements,
26 in immunotherapy protocols, and in other potential applications. Transgenic plant cells
27 and plants containing the encoding nucleic acid sequence can be particularly beneficial in
28 the control of insects, and as a nutritional/immunotherapy material.

DESCRIPTION OF THE FIGURES

The following figures form part of the present specification and are included to further demonstrate certain aspects of the present invention. The invention can be better understood by reference to one or more of these drawings in combination with the detailed description of specific embodiments presented herein.

Figure 1 illustrates the alignment of potato patatin PatA (acyl lipid hydrolase) with patatin (acyl lipid hydrolase) homologs and related amino acid sequences, the homologs and related sequences being from both dicot and monocot plant species.

Figure 2 illustrates IgE binding to overlapping peptide sequences.

Figure 3 illustrates construction of nucleic acid sequences encoding patatin permutein proteins, and in this figure for illustrative purposes a breakpoint at position 247 is shown.

DESCRIPTION OF THE SEQUENCE LISTINGS

The following description of the sequence listing forms part of the present specification and is included to further demonstrate certain aspects of the present invention. The invention can be better understood by reference to one or more of these sequences in combination with the detailed description of specific embodiments presented herein.

DEFINITIONS

The following definitions are provided in order to aid those skilled in the art in understanding the detailed description of the present invention. Some words and phrases may also be defined in other sections of the specification. No limitation should be placed on the definitions presented for the terms below, where other meanings are evidenced elsewhere in the specification in addition to those specified below.

“Allergen” refers to a biological or chemical substance that induces an allergic reaction or response. An allergic response can be an immunoglobulin E-mediated response.

Amino acid codes: A (Ala) = alanine; C (Cys) = cysteine; D (Asp) = aspartic acid; E (Glu) = glutamic acid; F (Phe) = phenylalanine; G (Gly) = glycine; H (His) = histidine; I (Ile) = isoleucine; K (Lys) = lysine; L (Leu) = leucine; M (Met) = methionine; N (Asn) = asparagine; P (Pro) = proline; Q (Gln) = glutamine; R (Arg) = arginine; S (Ser) = serine; T (Thr) = threonine; V (Val) = valine; W (Trp) = tryptophan; Y (Tyr) = tyrosine.

“Amplification” refers to increasing the number of copies of a desired molecule.

“Coding sequence”, “open reading frame”, and “structural sequence” refer to the region of continuous sequential nucleic acid base pair triplets encoding a protein, polypeptide, or peptide sequence.

“Codon” refers to a sequence of three nucleotides that specify a particular amino acid.

“Complementarity” refers to the specific binding of adenine to thymine (or uracil in RNA) and cytosine to guanine on opposite strands of DNA or RNA.

“Deallergenize” (render hypoallergenic) refers to the method of engineering or modifying a protein or the encoding DNA such that the protein has a reduced or eliminated ability to induce an allergic response with respect to the ability of the unmodified protein. A deallergenized protein can be referred to as being hypoallergenic. The degree of deallergenization of a protein can be measured *in vitro* by the reduced binding of IgE antibodies.

“DNA segment heterologous to the promoter region” means that the coding DNA segment does not exist in nature in the same gene with the promoter to which it is now attached.

1 “DNA segment” refers to a DNA molecule that has been isolated free of total
2 genomic DNA of a particular species.

3 “Electroporation” refers to a method of introducing foreign DNA into cells that
4 uses a brief, high voltage DC (direct current) charge to permeabilize the host cells,
5 causing them to take up extra-chromosomal DNA.

6 “Encoding DNA” refers to chromosomal DNA, plasmid DNA, cDNA, or
7 synthetic DNA which encodes any of the enzymes discussed herein.

8 “Endogenous” refers to materials originating from within an organism or cell.

9 “Endonuclease” refers to an enzyme that hydrolyzes double stranded DNA at
10 internal locations.

11 “Epitope” refers to a region on an allergen that interacts with the cells of the
12 immune system. Epitopes are often further defined by the type of antibody or cell with
13 which they interact, e.g. if the region reacts with B-cells or antibodies (IgE), it is called a
14 B-cell epitope.

15 “Exogenous” refers to materials originating from outside of an organism or cell.
16 This typically applies to nucleic acid molecules used in producing transformed or
17 transgenic host cells and plants.

18 “Expressibly coupled” and “expressibly linked” refer to a promoter or promoter
19 region and a coding or structural sequence in such an orientation and distance that
20 transcription of the coding or structural sequence can be directed by the promoter or
21 promoter region.

22 “Expression” refers to the transcription of a gene to produce the corresponding
23 mRNA and translation of this mRNA to produce the corresponding gene product, i.e., a
24 peptide, polypeptide, or protein.

25 “Heterologous DNA” refers to DNA from a source different than that of the
26 recipient cell.

27 “Homologous DNA” refers to DNA from the same source as that of the recipient
28 cell.

29 “Identity” refers to the degree of similarity between two nucleic acid or protein
30 sequences. An alignment of the two sequences is performed by a suitable computer
31 program. A widely used and accepted computer program for performing sequence

1 alignments is CLUSTALW v1.6 (Thompson, et al. *Nucl. Acids Res.*, 22: 4673-4680,
2 1994). The number of matching bases or amino acids is divided by the total number of
3 bases or amino acids, and multiplied by 100 to obtain a percent identity. For example, if
4 two 580 base pair sequences had 145 matched bases, they would be 25 percent identical.
5 If the two compared sequences are of different lengths, the number of matches is divided
6 by the shorter of the two lengths. For example, if there were 100 matched amino acids
7 between 200 and a 400 amino acid proteins, they are 50 percent identical with respect to
8 the shorter sequence. If the shorter sequence is less than 150 bases or 50 amino acids in
9 length, the number of matches are divided by 150 (for nucleic acid bases) or 50 (for
10 amino acids), and multiplied by 100 to obtain a percent identity.

11 "IgE" (Immunoglobulin E) refers to a specific class of immunoglobulin secreted
12 by B cells. IgE binds to specific receptors on Mast cells. Interaction of an allergen with
13 mast cell-bound IgE may trigger allergic symptoms.

14 "Immunotherapy" refers to any type of treatment that targets the immune system.
15 Allergy immunotherapy is a treatment in which a progressively increasing dose of an
16 allergen is given in order to induce an immune response characterized by tolerance to the
17 antigen/allergen, also known as desensitization.

18 "*In vitro*" refers to "in the laboratory" and/or "outside of a living organism".

19 "*In vivo*" refers to "in a living organism".

20 "Insecticidal polypeptide" refers to a polypeptide having insecticidal properties
21 that adversely affects the growth and development of insect pests.

22 "Monocot" refers to plants having a single cotyledon (the first leaf of the embryo
23 of seed plants); examples include cereals such as maize, rice, wheat, oats, and barley.

24 "Multiple cloning site" refers to an artificially constructed collection of restriction
25 enzyme sites in a vector that facilitates insertion of foreign DNA into the vector.

26 "Mutation" refers to any change or alteration in a nucleic acid sequence. Several
27 types exist, including point, frame shift, splicing, and insertion/deletions.

28 "Native" refers to "naturally occurring in the same organism". For example, a
29 native promoter is the promoter naturally found operatively linked to a given coding
30 sequence in an organism. A native protein is one naturally found in nature and untouched
31 or not otherwise manipulated by the hand of man.

1 “Nucleic acid segment” is a nucleic acid molecule that has been isolated free of
2 total genomic DNA of a particular species, or that has been synthesized. Included with
3 the term “nucleic acid segment” are DNA segments, recombinant vectors, plasmids,
4 cosmids, phagemids, phage, viruses, etcetera.

5 “Nucleic acid” refers to deoxyribonucleic acid (DNA) and ribonucleic acid
6 (RNA).

7 Nucleic acid codes: A = adenosine; C = cytosine; G = guanosine; T = thymidine;
8 N = equimolar A, C, G, and T; I = deoxyinosine; K = equimolar G and T; R = equimolar
9 A and G; S = equimolar C and G; W = equimolar A and T; Y = equimolar C and T.

10 “Open reading frame (ORF)” refers to a region of DNA or RNA encoding a
11 peptide, polypeptide, or protein or capable of being translated to protein, or a regioiu of
12 DNA capable of being transcribed into an RNA product.

13 “Plasmid” refers to a circular, extrachromosomal, self-replicating piece of DNA.

14 “Point mutation” refers to an alteration of a single nucleotide in a nucleic acid
15 sequence.

16 “Polymerase chain reaction (PCR)” refers to an enzymatic technique to create
17 multiple copies of one sequence of nucleic acid. Copies of DNA sequence are prepared
18 by shuttling a DNA polymerase between two oligonucleotides. The basis of this
19 amplification method is multiple cycles of temperature changes to denature, then re-
20 anneal amplimers, followed by extension to synthesize new DNA strands in the region
21 located between the flanking amplimers. Also known as thermal amplification.

22 “Probe” refers to a polynucleotide sequence which is complementary to a target
23 polynucleotide sequence in the analyte. An antibody can also be used as a probe to detect
24 the presence of an antigen. In that sense, the antigen binding domain of the antibody has
25 some detectable affinity for the antigen and binds thereto. The binding of the antibody to
26 the antigen can be measured by means known in the art, such as by chemiluminescence,
27 phosphorescence, flourescence, colorimetric chemical deposition at the site of binding, or
28 otherwise.

29 “Promoter” or “promoter region” refers to a DNA sequence, usually found
30 upstream (5') to a coding sequence, that controls expression of the coding sequence by
31 controlling production of messenger RNA (mRNA) by providing the recognition site for

1 RNA polymerase and/or other factors necessary for start of transcription at the correct
2 site. As contemplated herein, a promoter or promoter region includes variations of
3 promoters derived by means of ligation to various regulatory sequences, random or
4 controlled mutagenesis, and addition or duplication of enhancer sequences. The
5 promoter region disclosed herein, and biologically functional equivalents thereof, are
6 responsible for driving the transcription of coding sequences under their control when
7 introduced into a host as part of a suitable recombinant vector, as demonstrated by its
8 ability to produce mRNA.

9 “Recombinant DNA construct” or “recombinant vector” refers to any agent such
10 as a plasmid, cosmid, virus, autonomously replicating sequence, phage, or linear or
11 circular single-stranded or double-stranded DNA or RNA nucleotide sequence, derived
12 from any source, capable of genomic integration or autonomous replication, comprising a
13 DNA molecule in which one or more DNA sequences have been linked in a functionally
14 operative manner. Such recombinant DNA constructs or vectors are capable of
15 introducing a 5’ regulatory sequence or promoter region and a DNA sequence for a
16 selected gene product into a cell in such a manner that the DNA sequence is transcribed
17 into a functional mRNA which is translated and therefore expressed. Recombinant DNA
18 constructs or recombinant vectors can be constructed to be capable of expressing
19 antisense RNAs, in order to inhibit translation of a specific RNA of interest.

20 “Recombinant proteins”, also referred to as “heterologous proteins”, are proteins
21 which are normally not produced by the host cell.

22 “Regeneration” refers to the process of growing a plant from a plant cell (e.g.,
23 plant protoplast or explant).

24 “Regeneration” refers to the process of growing a plant from a plant cell (e.g.,
25 plant protoplast or explant).

26 “Regulatory sequence” refers to a nucleotide sequence located upstream (5’),
27 within, and/or downstream (3’) to a DNA sequence encoding a selected gene product
28 whose transcription and expression is controlled by the regulatory sequence in
29 conjunction with the protein synthetic apparatus of the cell.

1 “Restriction enzyme” refers to an enzyme that recognizes a specific palindromic
2 sequence of nucleotides in double stranded DNA and cleaves both strands; also called a
3 restriction endonuclease. Cleavage typically occurs within the restriction site.

4 “Result-effective substitution” (RES) refers to an amino acid substitution within
5 an IgE-binding region (epitope) of a target protein which reduces or eliminates the IgE
6 binding by that epitope. Examples herein are directed to patatin protein and homologues,
7 however, as will be readily recognized by those skilled in the art, the method is more
8 broadly applicable to proteins other than patatins, and in particular is applicable to any
9 protein exhibiting allergen eliciting properties.

10 “Selectable marker” refers to a nucleic acid sequence whose expression confers a
11 phenotype facilitating identification of cells containing the nucleic acid sequence.
12 Selectable markers include those which confer resistance to toxic chemicals (e.g.
13 ampicillin resistance, kanamycin resistance), complement a nutritional deficiency (e.g.
14 uracil, histidine, leucine), or impart a visually distinguishing characteristic (e.g. color
15 changes or fluorescence).

16 “Transcription” refers to the process of producing an RNA copy from a DNA
17 template.

18 “Transformation” refers to a process of introducing an exogenous nucleic acid
19 sequence (e.g., a vector, recombinant nucleic acid molecule) into a cell or protoplast in
20 which that exogenous nucleic acid is incorporated into a chromosome or is capable of
21 autonomous replication.

22 “Transformed cell” is a cell whose DNA has been altered by the introduction of
23 an exogenous nucleic acid molecule into that cell.

24 “Transgenic cell” refers to any cell derived from or regenerated from a
25 transformed cell or derived from a transgenic cell. Exemplary transgenic cells include
26 plant calli derived from a transformed plant cell and particular cells such as leaf, root,
27 stem, *e.g.*, somatic cells, or reproductive (germ) cells obtained from a transgenic plant.

28 “Transgenic plant” refers to a plant or progeny thereof derived from a transformed
29 plant cell or protoplast, wherein the plant DNA contains an introduced exogenous nucleic
30 acid sequence not originally present in a native, non-transgenic plant of the same species.

1 Alternatively, the plant DNA can contain the introduced nucleic acid sequence in a higher
2 copy number than in the native, non-transgenic plant of the same species.

3 “Translation” refers to the production of protein from messenger RNA.

4 “Vector” refers to a plasmid, cosmid, bacteriophage, or virus that carries foreign
5 DNA into a host organism.

6 “Western blot” refers to protein or proteins that have been separated by
7 electrophoresis, transferred and immobilized onto a solid support, then probed with an
8 antibody.

9 DETAILED DESCRIPTION OF THE INVENTION

10 Design of deallergenized patatin proteins

11 Deallergenizing a protein can be accomplished by the identification of allergenic
12 sites, followed by modification of the sites to reduce or eliminate the binding of
13 antibodies to the sites. The IgE-binding regions of patatin were previously unreported.
14 Mapping of the IgE epitopes was accomplished by synthesizing 10-mer peptides based on
15 the patatin 17 protein sequence (SEQ ID NO: 2) which overlap by six amino acids. As
16 potato proteins are denatured upon cooking potato products, it is expected that the 10-mer
17 peptides sufficiently mimic the unfolded full length protein for antibody binding
18 purposes. Peptides were identified based upon their ability to bind to IgE antibodies.
19 Individual amino acids within the identified peptides were changed to reduce or eliminate
20 binding to IgE present in sera from potato sensitive patients. These changes are termed
21 result-effective amino acid substitutions (RES). The RES can be subsequently introduced
22 into the full length protein by site directed mutagenesis of the encoding nucleic acid
23 sequence or other means known in the art. Similar strategies have been employed
24 elsewhere to determine the dominant IgE epitopes in a major peanut allergen (Stanley,
25 J.S., *et al.*, *Arch. Biochem. Biophys.*, 342(2): 244-253, 1997).

26 Certain amino acid residues important for allergenicity of patatin are identified.
27 Some of the designed patatin peptides wherein single amino acid residues were replaced
28 with alanine or phenylalanine, showed significantly reduced or no binding to sera from
29 potato sensitive patients.

1 A “deallergenized patatin” refers to a patatin protein differing in at least one of
2 the amino acid residues as defined by the result effective substitutions resulting in the
3 patatin protein having reduced reactivity towards sera from potato sensitive patients. The
4 deallergenized patatin preferably maintains insecticidal properties, and preferably
5 maintains its characteristic enzymatic profile.

6 Summary of method to deallergenize a patatin protein

- 7 ▪ Mapping of IgE epitopes by immunoassay of synthetic overlapping peptides
8 using sera from potato sensitive patients;
- 9 ▪ Identification of result-effective substitutions by alanine scanning and/or
10 rational scanning;
- 11 ▪ Modification of the amino acid sequence of patatin by site-directed
12 mutagenesis of the encoding nucleic acid sequence;
- 13 ▪ Evaluation of enzyme activity (esterase) and/or insecticidal activity of the
14 modified protein(s); and
- 15 ▪ Evaluation of the new protein(s) for allergenicity by IgE immunoassay.

16
17 Nucleic acid sequences encoding patatin have been cloned by several
18 investigators (e.g. Mignery, *et al.*, *Nucleic Acids Research*, 12: 7987-8000, 1984;
19 Mignery, *et al.*, *Gene*, 62: 27-44, 1988; WO 94/21805; Canadian Patent Application No.
20 2090552). These nucleic acid sequences can then be manipulated using site directed
21 mutagenesis to encode a hypoallergenic patatin. These nucleic acid sequences can than
22 be used to transform bacterial, yeast or plant cells, resulting in the production of
23 hypoallergenic patatin protein.

24 Deallergenized patatin proteins

25 For simplicity, individual amino acids are referred to by their single letter codes.
26 Correlation between the single letter codes, three letter codes, and full amino acid names
27 is presented in the definitions section above.

28 One embodiment of the invention is an isolated deallergenized patatin protein.
29 The protein is modified relative to the wild-type protein sequence such that they exhibit

1 reduced binding to anti-patatin antibodies such as those obtained from humans or animals
2 allergic to potatoes. The reduced binding is measured relative to the binding of the
3 unmodified patatin protein to the anti-patatin antibodies.

4 The deallergenized patatin protein can comprise SEQ ID NO:2 modified in one or
5 more of the following regions, or SEQ ID NO:7 modified in one or more of the following
6 regions. The single or multiple amino acid modifications reduce the binding of the
7 modified protein relative to the binding of the corresponding unmodified protein. The
8 regions for modification include amino acid positions 104-113 of SEQ ID NO:2 (85-94
9 of SEQ ID NO:7), 128-137 of SEQ ID NO:2 (109-118 of SEQ ID NO:7), 184-197 of
10 SEQ ID NO:2 (165-178 of SEQ ID NO:7), 264-277 of SEQ ID NO:2 (245-258 of SEQ
11 ID NO:7), 316-325 of SEQ ID NO:2 (297-306 of SEQ ID NO:7), and 360-377 of SEQ ID
12 NO:2 (341-358 of SEQ ID NO:7). The possible amino acid modifications include
13 replacing an amino acid with A, E, F, P, or S. The modifications replace one or more
14 amino acids in the identified regions, without increasing or decreasing the total number of
15 amino acids in the protein.

16 Preferably, the deallergenized patatin protein comprises SEQ ID NO:2 modified
17 by one or more changes, or SEQ ID NO:7 modified by one or more changes. SEQ ID
18 NO:7 differs from wild type SEQ ID NO:2 in that the first 22 amino acids of SEQ ID
19 NO:2 are replaced with EAE (Glu-Ala-Glu). For example, the changes to SEQ ID NO:2
20 or SEQ ID NO:7 can be: the Y corresponding to position 106 of SEQ ID NO:2 or
21 position 87 of SEQ ID NO:7 is replaced with F or A; the I corresponding to position 113
22 of SEQ ID NO:2 or position 94 of SEQ ID NO:7 is replaced with A; the Y corresponding
23 to position 129 of SEQ ID NO:2 or position 110 of SEQ ID NO:7 is replaced with F or
24 A; the K corresponding to position 137 of SEQ ID NO:2 or position 118 of SEQ ID NO:7
25 is replaced with A; the S corresponding to position 184 of SEQ ID NO:2 or position 165
26 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 185 of SEQ ID
27 NO:2 or position 166 of SEQ ID NO:7 is replaced with F or A; the A corresponding to
28 position 188 of SEQ ID NO:2 or position 169 of SEQ ID NO:7 is replaced with S; the T
29 corresponding to position 192 of SEQ ID NO:2 or position 173 of SEQ ID NO:7 is
30 replaced with A or P; the Y corresponding to position 193 of SEQ ID NO:2 or position
31 174 of SEQ ID NO:7 is replaced with F or A; the K corresponding to position 268 of

1 SEQ ID NO:2 or position 249 of SEQ ID NO:7 is replaced with A or E; the T
2 corresponding to position 269 of SEQ ID NO:2 or position 250 of SEQ ID NO:7 is
3 replaced with A; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
4 SEQ ID NO:7 is replaced with F or A; the K corresponding to position 273 of SEQ ID
5 NO:2 or position 254 of SEQ ID NO:7 is replaced with A; the K corresponding to
6 position 313 of SEQ ID NO:2 or position 294 of SEQ ID NO:7 is replaced with E; the N
7 corresponding to position 314 of SEQ ID NO:2 or position 295 of SEQ ID NO:7 is
8 replaced with A; the N corresponding to position 315 of SEQ ID NO:2 or position 296 of
9 SEQ ID NO:7 is replaced with A; the Y corresponding to position 316 of SEQ ID NO:2
10 or position 297 of SEQ ID NO:7 is replaced with F or A; the Y corresponding to position
11 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F; the K
12 corresponding to position 367 of SEQ ID NO:2 or position 348 of SEQ ID NO:7 is
13 replaced with A; the R corresponding to position 368 of SEQ ID NO:2 or position 349 of
14 SEQ ID NO:7 is replaced with A; the F corresponding to position 369 of SEQ ID NO:2
15 or position 350 of SEQ ID NO:7 is replaced with A; the K corresponding to position 371
16 of SEQ ID NO:2 or position 352 of SEQ ID NO:7 is replaced with A; the L
17 corresponding to position 372 of SEQ ID NO:2 or position 353 of SEQ ID NO:7 is
18 replaced with A; and the L corresponding to position 373 of SEQ ID NO:2 or position
19 354 of SEQ ID NO:7 is replaced with A.

20 More preferably, SEQ ID NO:2 is modified by the following changes or SEQ ID
21 NO:7 is modified by the following changes: the Y corresponding to position 106 of SEQ
22 ID NO:2 or position 87 of SEQ ID NO:7 is replaced with F; the Y corresponding to
23 position 129 of SEQ ID NO:2 or position 110 of SEQ ID NO:7 is replaced with F; the Y
24 corresponding to position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is
25 replaced with F; the Y corresponding to position 193 of SEQ ID NO:2 or position 174 of
26 SEQ ID NO:7 is replaced with F; the Y corresponding to position 270 of SEQ ID NO:2
27 or position 251 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 316
28 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is replaced with F; and the Y
29 corresponding to position 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is
30 replaced with F.

1 Most preferably, SEQ ID NO:2 is modified by the following changes or SEQ ID
2 NO:7 is modified by the following changes: the Y corresponding to position 185 of SEQ
3 ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F; the Y corresponding to
4 position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y
5 corresponding to position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is
6 replaced with F; the Y corresponding to position 316 of SEQ ID NO:2 or position 297 of
7 SEQ ID NO:7 is replaced with F; and the Y corresponding to position 362 of SEQ ID
8 NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

9 Nucleic acids

10 An additional embodiment of the invention is an isolated nucleic acid molecule
11 segment comprising a structural nucleic acid sequence which encodes a deallergenized
12 patatin protein.

13 The structural nucleic acid sequence can generally encode any deallergenized
14 patatin protein. The structural nucleic acid sequence preferably encodes a deallergenized
15 patatin protein comprising SEQ ID NO:2 modified in one or more of the following
16 regions, or SEQ ID NO:7 modified in one or more of the following regions. The single
17 or multiple amino acid modifications reduce the binding of the modified protein relative
18 to the binding of the corresponding unmodified protein. The regions for modification
19 include amino acid positions 104-113 of SEQ ID NO:2 (85-94 of SEQ ID NO:7), 128-
20 137 of SEQ ID NO:2 (109-118 of SEQ ID NO:7), 184-197 of SEQ ID NO:2 (165-178 of
21 SEQ ID NO:7), 264-277 of SEQ ID NO:2 (245-258 of SEQ ID NO:7), 316-325 of SEQ
22 ID NO:2 (297-306 of SEQ ID NO:7), and 360-377 of SEQ ID NO:2 (341-358 of SEQ ID
23 NO:7). The possible amino acid modifications include replacing an amino acid with A,
24 E, F, P, or S. The modifications replace one or more amino acids in the identified
25 regions, without increasing or decreasing the total number of amino acids in the protein.

26 Alternatively, the structural nucleic acid sequence encodes SEQ ID NO:2
27 modified by one or more of the following changes or encoding SEQ ID NO:7 modified
28 by one or more of the following changes: the Y corresponding to position 106 of SEQ ID
29 NO:2 or position 87 of SEQ ID NO:7 is replaced with F or A; the I corresponding to
30 position 113 of SEQ ID NO:2 or position 94 of SEQ ID NO:7 is replaced with A; the Y

1 corresponding to position 129 of SEQ ID NO:2 or position 110 of SEQ ID NO:7 is
2 replaced with F or A; the K corresponding to position 137 of SEQ ID NO:2 or position
3 118 of SEQ ID NO:7 is replaced with A; the S corresponding to position 184 of SEQ ID
4 NO:2 or position 165 of SEQ ID NO:7 is replaced with A; the Y corresponding to
5 position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F or A;
6 the A corresponding to position 188 of SEQ ID NO:2 or position 169 of SEQ ID NO:7 is
7 replaced with S; the T corresponding to position 192 of SEQ ID NO:2 or position 173 of
8 SEQ ID NO:7 is replaced with A or P; the Y corresponding to position 193 of SEQ ID
9 NO:2 or position 174 of SEQ ID NO:7 is replaced with F or A; the K corresponding to
10 position 268 of SEQ ID NO:2 or position 249 of SEQ ID NO:7 is replaced with A or E;
11 the T corresponding to position 269 of SEQ ID NO:2 or position 250 of SEQ ID NO:7 is
12 replaced with A; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
13 SEQ ID NO:7 is replaced with F or A; the K corresponding to position 273 of SEQ ID
14 NO:2 or position 254 of SEQ ID NO:7 is replaced with A; the K corresponding to
15 position 313 of SEQ ID NO:2 or position 294 of SEQ ID NO:7 is replaced with E; the N
16 corresponding to position 314 of SEQ ID NO:2 or position 295 of SEQ ID NO:7 is
17 replaced with A; the N corresponding to position 315 of SEQ ID NO:2 or position 296 of
18 SEQ ID NO:7 is replaced with A; the Y corresponding to position 316 of SEQ ID NO:2
19 or position 297 of SEQ ID NO:7 is replaced with F or A; the Y corresponding to position
20 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F; the K
21 corresponding to position 367 of SEQ ID NO:2 or position 348 of SEQ ID NO:7 is
22 replaced with A; the R corresponding to position 368 of SEQ ID NO:2 or position 349 of
23 SEQ ID NO:7 is replaced with A; the F corresponding to position 369 of SEQ ID NO:2
24 or position 350 of SEQ ID NO:7 is replaced with A; the K corresponding to position 371
25 of SEQ ID NO:2 or position 352 of SEQ ID NO:7 is replaced with A; the L
26 corresponding to position 372 of SEQ ID NO:2 or position 353 of SEQ ID NO:7 is
27 replaced with A; and the L corresponding to position 373 of SEQ ID NO:2 or position
28 354 of SEQ ID NO:7 is replaced with A.

29 More preferably, the structural nucleic acid sequence encodes SEQ ID NO:2
30 modified by the following changes or SEQ ID NO:7 modified by the following changes:
31 the Y corresponding to position 106 of SEQ ID NO:2 or position 87 of SEQ ID NO:7 is

1 replaced with F; the Y corresponding to position 129 of SEQ ID NO:2 or position 110 of
2 SEQ ID NO:7 is replaced with F; the Y corresponding to position 185 of SEQ ID NO:2
3 or position 166 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 193
4 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y
5 corresponding to position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is
6 replaced with F; the Y corresponding to position 316 of SEQ ID NO:2 or position 297 of
7 SEQ ID NO:7 is replaced with F; and the Y corresponding to position 362 of SEQ ID
8 NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

9 Most preferably, the structural nucleic acid sequence encodes SEQ ID NO:2
10 modified by the following changes or SEQ ID NO:7 modified by the following changes:
11 the Y corresponding to position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is
12 replaced with F; the Y corresponding to position 193 of SEQ ID NO:2 or position 174 of
13 SEQ ID NO:7 is replaced with F; the Y corresponding to position 270 of SEQ ID NO:2
14 or position 251 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 316
15 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is replaced with F; and the Y
16 corresponding to position 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is
17 replaced with F.

18 Recombinant vectors

19 An additional embodiment is directed towards recombinant vectors comprising a
20 structural nucleic acid sequence which encodes a deallergenized patatin protein. The
21 recombinant vector comprises operatively linked in the 5' to 3' orientation: a promoter
22 that directs transcription of a structural nucleic acid sequence; a structural nucleic acid
23 sequence, and a 3' transcription terminator.

24 The structural nucleic acid sequence can encode SEQ ID NO:2 modified in one or
25 more of the following regions, or SEQ ID NO:7 modified in one or more of the following
26 regions. The single or multiple amino acid modifications reduce the binding of the
27 modified protein relative to the binding of the corresponding unmodified protein. The
28 regions for modification include amino acid positions 104-113 of SEQ ID NO:2 (85-94
29 of SEQ ID NO:7), 128-137 of SEQ ID NO:2 (109-118 of SEQ ID NO:7), 184-197 of
30 SEQ ID NO:2 (165-178 of SEQ ID NO:7), 264-277 of SEQ ID NO:2 (245-258 of SEQ

1 ID NO:7), 316-325 of SEQ ID NO:2 (297-306 of SEQ ID NO:7), and 360-377 of SEQ ID
2 NO:2 (341-358 of SEQ ID NO:7). The possible amino acid modifications include
3 replacing an amino acid with A, E, F, P, or S. The modifications replace one or more
4 amino acids in the identified regions, without increasing or decreasing the total number of
5 amino acids in the protein.

6 Alternatively, the recombinant vector comprises operatively linked in the 5' to 3'
7 orientation: a promoter that directs transcription of a structural nucleic acid sequence; a
8 structural nucleic acid sequence encoding SEQ ID NO:2 modified by one or more of the
9 following changes or encoding SEQ ID NO:7 modified by one or more of the following
10 changes: the Y corresponding to position 106 of SEQ ID NO:2 or position 87 of SEQ ID
11 NO:7 is replaced with F or A; the I corresponding to position 113 of SEQ ID NO:2 or
12 position 94 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 129 of
13 SEQ ID NO:2 or position 110 of SEQ ID NO:7 is replaced with F or A; the K
14 corresponding to position 137 of SEQ ID NO:2 or position 118 of SEQ ID NO:7 is
15 replaced with A; the S corresponding to position 184 of SEQ ID NO:2 or position 165 of
16 SEQ ID NO:7 is replaced with A; the Y corresponding to position 185 of SEQ ID NO:2
17 or position 166 of SEQ ID NO:7 is replaced with F or A; the A corresponding to position
18 188 of SEQ ID NO:2 or position 169 of SEQ ID NO:7 is replaced with S; the T
19 corresponding to position 192 of SEQ ID NO:2 or position 173 of SEQ ID NO:7 is
20 replaced with A or P; the Y corresponding to position 193 of SEQ ID NO:2 or position
21 174 of SEQ ID NO:7 is replaced with F or A; the K corresponding to position 268 of
22 SEQ ID NO:2 or position 249 of SEQ ID NO:7 is replaced with A or E; the T
23 corresponding to position 269 of SEQ ID NO:2 or position 250 of SEQ ID NO:7 is
24 replaced with A; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
25 SEQ ID NO:7 is replaced with F or A; the K corresponding to position 273 of SEQ ID
26 NO:2 or position 254 of SEQ ID NO:7 is replaced with A; the K corresponding to
27 position 313 of SEQ ID NO:2 or position 294 of SEQ ID NO:7 is replaced with E; the N
28 corresponding to position 314 of SEQ ID NO:2 or position 295 of SEQ ID NO:7 is
29 replaced with A; the N corresponding to position 315 of SEQ ID NO:2 or position 296 of
30 SEQ ID NO:7 is replaced with A; the Y corresponding to position 316 of SEQ ID NO:2
31 or position 297 of SEQ ID NO:7 is replaced with F or A; the Y corresponding to position

1 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F; the K
2 corresponding to position 367 of SEQ ID NO:2 or position 348 of SEQ ID NO:7 is
3 replaced with A; the R corresponding to position 368 of SEQ ID NO:2 or position 349 of
4 SEQ ID NO:7 is replaced with A; the F corresponding to position 369 of SEQ ID NO:2
5 or position 350 of SEQ ID NO:7 is replaced with A; the K corresponding to position 371
6 of SEQ ID NO:2 or position 352 of SEQ ID NO:7 is replaced with A; the L
7 corresponding to position 372 of SEQ ID NO:2 or position 353 of SEQ ID NO:7 is
8 replaced with A; and the L corresponding to position 373 of SEQ ID NO:2 or position
9 354 of SEQ ID NO:7 is replaced with A; and a 3' transcription terminator.

10 More preferably, the vector comprises a structural nucleic acid sequence encoding
11 SEQ ID NO:2 modified by the following changes or SEQ ID NO:7 modified by the
12 following changes: the Y corresponding to position 106 of SEQ ID NO:2 or position 87
13 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 129 of SEQ ID
14 NO:2 or position 110 of SEQ ID NO:7 is replaced with F; the Y corresponding to
15 position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F; the Y
16 corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
17 replaced with F; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
18 SEQ ID NO:7 is replaced with F; the Y corresponding to position 316 of SEQ ID NO:2
19 or position 297 of SEQ ID NO:7 is replaced with F; and the Y corresponding to position
20 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

21 Most preferably, the vector comprises a structural nucleic acid sequence encoding
22 SEQ ID NO:2 modified by the following changes or SEQ ID NO:7 modified by the
23 following changes: the Y corresponding to position 185 of SEQ ID NO:2 or position 166
24 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 193 of SEQ ID
25 NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y corresponding to
26 position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is replaced with F; the Y
27 corresponding to position 316 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is
28 replaced with F; and the Y corresponding to position 362 of SEQ ID NO:2 or position
29 343 of SEQ ID NO:7 is replaced with F.

1 Recombinant host cells

2 A further embodiment of the invention is directed towards recombinant host cells
3 comprising a structural nucleic acid sequence encoding a deallergenized patatin protein.
4 The recombinant host cell preferably produces a deallergenized patatin protein. More
5 preferably, the recombinant host cell produces a deallergenized patatin protein in a
6 concentration sufficient to inhibit growth or to kill an insect which ingests the
7 recombinant host cell. The recombinant host cell can generally comprise any structural
8 nucleic acid sequence encoding a deallergenized patatin protein.

9 The recombinant host cell can comprise a structural nucleic acid sequence
10 encoding SEQ ID NO:2 modified in one or more of the following regions, or SEQ ID
11 NO:7 modified in one or more of the following regions. The single or multiple amino
12 acid modifications reduce the binding of the modified protein relative to the binding of
13 the corresponding unmodified protein. The regions for modification include amino acid
14 positions 104-113 of SEQ ID NO:2 (85-94 of SEQ ID NO:7), 128-137 of SEQ ID NO:2
15 (109-118 of SEQ ID NO:7), 184-197 of SEQ ID NO:2 (165-178 of SEQ ID NO:7), 264-
16 277 of SEQ ID NO:2 (245-258 of SEQ ID NO:7), 316-325 of SEQ ID NO:2 (297-306 of
17 SEQ ID NO:7), and 360-377 of SEQ ID NO:2 (341-358 of SEQ ID NO:7). The possible
18 amino acid modifications include replacing an amino acid with A, E, F, P, or S. The
19 modifications replace one or more amino acids in the identified regions, without
20 increasing or decreasing the total number of amino acids in the protein.

21 Alternatively, the recombinant host cell comprises a structural nucleic acid
22 sequence encoding SEQ ID NO:2 modified by one or more of the following changes or
23 encoding SEQ ID NO:7 modified by one or more of the following changes: the Y
24 corresponding to position 106 of SEQ ID NO:2 or position 87 of SEQ ID NO:7 is
25 replaced with F or A; the I corresponding to position 113 of SEQ ID NO:2 or position 94
26 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 129 of SEQ ID
27 NO:2 or position 110 of SEQ ID NO:7 is replaced with F or A; the K corresponding to
28 position 137 of SEQ ID NO:2 or position 118 of SEQ ID NO:7 is replaced with A; the S
29 corresponding to position 184 of SEQ ID NO:2 or position 165 of SEQ ID NO:7 is
30 replaced with A; the Y corresponding to position 185 of SEQ ID NO:2 or position 166 of
31 SEQ ID NO:7 is replaced with F or A; the A corresponding to position 188 of SEQ ID

1 NO:2 or position 169 of SEQ ID NO:7 is replaced with S; the T corresponding to position
2 192 of SEQ ID NO:2 or position 173 of SEQ ID NO:7 is replaced with A or P; the Y
3 corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
4 replaced with F or A; the K corresponding to position 268 of SEQ ID NO:2 or position
5 249 of SEQ ID NO:7 is replaced with A or E; the T corresponding to position 269 of
6 SEQ ID NO:2 or position 250 of SEQ ID NO:7 is replaced with A; the Y corresponding
7 to position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is replaced with F or
8 A; the K corresponding to position 273 of SEQ ID NO:2 or position 254 of SEQ ID NO:7
9 is replaced with A; the K corresponding to position 313 of SEQ ID NO:2 or position 294
10 of SEQ ID NO:7 is replaced with E; the N corresponding to position 314 of SEQ ID
11 NO:2 or position 295 of SEQ ID NO:7 is replaced with A; the N corresponding to
12 position 315 of SEQ ID NO:2 or position 296 of SEQ ID NO:7 is replaced with A; the Y
13 corresponding to position 316 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is
14 replaced with F or A; the Y corresponding to position 362 of SEQ ID NO:2 or position
15 343 of SEQ ID NO:7 is replaced with F; the K corresponding to position 367 of SEQ ID
16 NO:2 or position 348 of SEQ ID NO:7 is replaced with A; the R corresponding to
17 position 368 of SEQ ID NO:2 or position 349 of SEQ ID NO:7 is replaced with A; the F
18 corresponding to position 369 of SEQ ID NO:2 or position 350 of SEQ ID NO:7 is
19 replaced with A; the K corresponding to position 371 of SEQ ID NO:2 or position 352 of
20 SEQ ID NO:7 is replaced with A; the L corresponding to position 372 of SEQ ID NO:2
21 or position 353 of SEQ ID NO:7 is replaced with A; and the L corresponding to position
22 373 of SEQ ID NO:2 or position 354 of SEQ ID NO:7 is replaced with A.

23 More preferably, the recombinant host cell comprises a structural nucleic acid
24 sequence encoding SEQ ID NO:2 modified by the following changes or SEQ ID NO:7
25 modified by the following changes: the Y corresponding to position 106 of SEQ ID NO:2
26 or position 87 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 129 of
27 SEQ ID NO:2 or position 110 of SEQ ID NO:7 is replaced with F; the Y corresponding
28 to position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F; the
29 Y corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
30 replaced with F; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
31 SEQ ID NO:7 is replaced with F; the Y corresponding to position 316 of SEQ ID NO:2

1 or position 297 of SEQ ID NO:7 is replaced with F; and the Y corresponding to position
2 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

3 Most preferably, the recombinant host cell comprises a structural nucleic acid
4 sequence encoding SEQ ID NO:2 modified by the following changes or SEQ ID NO:7
5 modified by the following changes: the Y corresponding to position 185 of SEQ ID NO:2
6 or position 166 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 193
7 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y
8 corresponding to position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is
9 replaced with F; the Y corresponding to position 316 of SEQ ID NO:2 or position 297 of
10 SEQ ID NO:7 is replaced with F; and the Y corresponding to position 362 of SEQ ID
11 NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

12 The recombinant host cell can generally be any type of host cell, and preferably is
13 a bacterial, fungal, or plant cell. The bacterial cell is preferably an *Escherichia coli*
14 bacterial cell. The fungal cell is preferably a *Saccharomyces cerevisiae*,
15 *Schizosaccharomyces pombe*, or *Pichia pastoris* fungal cell. The plant cell can be a
16 monocot, dicot, or conifer plant cell. The plant cell is preferably an alfalfa, banana,
17 canola, corn, cotton, cucumber, peanut, potato, rice, soybean, sunflower, sweet potato,
18 tobacco, tomato, or wheat plant cell. The recombinant host cell preferably further
19 comprises operatively linked to the structural nucleic acid sequence a promoter that
20 directs transcription of the structural nucleic acid sequence. The recombinant host cell
21 preferably further comprises operatively linked to the structural nucleic acid sequence a
22 3' transcription terminator and a polyadenylation site.

23 Recombinant plants

24 An additional embodiment of the invention is a recombinant plant comprising a
25 structural nucleic acid sequence encoding a deallergenized patatin protein. The
26 recombinant plant preferably produces a deallergenized patatin protein. More preferably,
27 the recombinant plant produces a deallergenized patatin protein in a concentration
28 sufficient to inhibit growth or to kill an insect which ingests plant tissue from the
29 recombinant plant.

1 The recombinant plant can comprise a structural nucleic acid sequence encoding
2 SEQ ID NO:2 modified in one or more of the following regions, or SEQ ID NO:7
3 modified in one or more of the following regions. The single or multiple amino acid
4 modifications reduce the binding of the modified protein relative to the binding of the
5 corresponding unmodified protein. The regions for modification include amino acid
6 positions 104-113 of SEQ ID NO:2 (85-94 of SEQ ID NO:7), 128-137 of SEQ ID NO:2
7 (109-118 of SEQ ID NO:7), 184-197 of SEQ ID NO:2 (165-178 of SEQ ID NO:7), 264-
8 277 of SEQ ID NO:2 (245-258 of SEQ ID NO:7), 316-325 of SEQ ID NO:2 (297-306 of
9 SEQ ID NO:7), and 360-377 of SEQ ID NO:2 (341-358 of SEQ ID NO:7). The possible
10 amino acid modifications include replacing an amino acid with A, E, F, P, or S. The
11 modifications replace one or more amino acids in the identified regions, without
12 increasing or decreasing the total number of amino acids in the protein.

13 Alternatively, the recombinant plant can comprise a structural nucleic acid
14 sequence encoding SEQ ID NO:2 modified by one or more of the following changes or
15 encoding SEQ ID NO:7 modified by one or more of the following changes: the Y
16 corresponding to position 106 of SEQ ID NO:2 or position 87 of SEQ ID NO:7 is
17 replaced with F or A; the I corresponding to position 113 of SEQ ID NO:2 or position 94
18 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 129 of SEQ ID
19 NO:2 or position 110 of SEQ ID NO:7 is replaced with F or A; the K corresponding to
20 position 137 of SEQ ID NO:2 or position 118 of SEQ ID NO:7 is replaced with A; the S
21 corresponding to position 184 of SEQ ID NO:2 or position 165 of SEQ ID NO:7 is
22 replaced with A; the Y corresponding to position 185 of SEQ ID NO:2 or position 166 of
23 SEQ ID NO:7 is replaced with F or A; the A corresponding to position 188 of SEQ ID
24 NO:2 or position 169 of SEQ ID NO:7 is replaced with S; the T corresponding to position
25 192 of SEQ ID NO:2 or position 173 of SEQ ID NO:7 is replaced with A or P; the Y
26 corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
27 replaced with F or A; the K corresponding to position 268 of SEQ ID NO:2 or position
28 249 of SEQ ID NO:7 is replaced with A or E; the T corresponding to position 269 of
29 SEQ ID NO:2 or position 250 of SEQ ID NO:7 is replaced with A; the Y corresponding
30 to position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is replaced with F or
31 A; the K corresponding to position 273 of SEQ ID NO:2 or position 254 of SEQ ID NO:7

1 is replaced with A; the K corresponding to position 313 of SEQ ID NO:2 or position 294
2 of SEQ ID NO:7 is replaced with E; the N corresponding to position 314 of SEQ ID
3 NO:2 or position 295 of SEQ ID NO:7 is replaced with A; the N corresponding to
4 position 315 of SEQ ID NO:2 or position 296 of SEQ ID NO:7 is replaced with A; the Y
5 corresponding to position 316 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is
6 replaced with F or A; the Y corresponding to position 362 of SEQ ID NO:2 or position
7 343 of SEQ ID NO:7 is replaced with F; the K corresponding to position 367 of SEQ ID
8 NO:2 or position 348 of SEQ ID NO:7 is replaced with A; the R corresponding to
9 position 368 of SEQ ID NO:2 or position 349 of SEQ ID NO:7 is replaced with A; the F
10 corresponding to position 369 of SEQ ID NO:2 or position 350 of SEQ ID NO:7 is
11 replaced with A; the K corresponding to position 371 of SEQ ID NO:2 or position 352 of
12 SEQ ID NO:7 is replaced with A; the L corresponding to position 372 of SEQ ID NO:2
13 or position 353 of SEQ ID NO:7 is replaced with A; and the L corresponding to position
14 373 of SEQ ID NO:2 or position 354 of SEQ ID NO:7 is replaced with A.

15 More preferably, the recombinant plant comprises a structural nucleic acid
16 sequence encoding SEQ ID NO:2 modified by the following changes or SEQ ID NO:7
17 modified by the following changes: the Y corresponding to position 106 of SEQ ID NO:2
18 or position 87 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 129 of
19 SEQ ID NO:2 or position 110 of SEQ ID NO:7 is replaced with F; the Y corresponding
20 to position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F; the
21 Y corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
22 replaced with F; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
23 SEQ ID NO:7 is replaced with F; the Y corresponding to position 316 of SEQ ID NO:2
24 or position 297 of SEQ ID NO:7 is replaced with F; and the Y corresponding to position
25 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

26 Most preferably, the recombinant plant comprises a structural nucleic acid
27 sequence encoding SEQ ID NO:2 modified by the following changes or SEQ ID NO:7
28 modified by the following changes: the Y corresponding to position 185 of SEQ ID NO:2
29 or position 166 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 193
30 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y
31 corresponding to position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is

1 replaced with F; the Y corresponding to position 316 of SEQ ID NO:2 or position 297 of
2 SEQ ID NO:7 is replaced with F; and the Y corresponding to position 362 of SEQ ID
3 NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

4 The recombinant plant can generally be any type of plant. The plant can be a
5 monocot, dicot, or conifer plant. The plant is preferably an alfalfa, banana, canola, corn,
6 cotton, cucumber, peanut, potato, rice, soybean, sunflower, sweet potato, tobacco,
7 tomato, or wheat plant.

8 The recombinant plant preferably further comprises operatively linked to the
9 structural nucleic acid sequence a promoter that directs transcription of the structural
10 nucleic acid sequence. The recombinant plant preferably further comprises operatively
11 linked to the structural nucleic acid sequence a 3' transcription terminator and a
12 polyadenylation site.

13 Methods of preparation

14 Embodiments of the invention are further directed towards methods of preparing
15 recombinant host cells and recombinant plants useful for the production of deallergenized
16 patatin proteins.

17 A method of preparing a recombinant host cell useful for the production of
18 deallergenized patatin proteins can comprise selecting a host cell; transforming the host
19 cell with a recombinant vector; and obtaining recombinant host cells.

20 The recombinant vector comprises a structural nucleic acid sequence encoding
21 SEQ ID NO:2 modified in one or more of the following regions, or SEQ ID NO:7
22 modified in one or more of the following regions. The single or multiple amino acid
23 modifications reduce the binding of the modified protein relative to the binding of the
24 corresponding unmodified protein. The regions for modification include amino acid
25 positions 104-113 of SEQ ID NO:2 (85-94 of SEQ ID NO:7), 128-137 of SEQ ID NO:2
26 (109-118 of SEQ ID NO:7), 184-197 of SEQ ID NO:2 (165-178 of SEQ ID NO:7), 264-
27 277 of SEQ ID NO:2 (245-258 of SEQ ID NO:7), 316-325 of SEQ ID NO:2 (297-306 of
28 SEQ ID NO:7), and 360-377 of SEQ ID NO:2 (341-358 of SEQ ID NO:7). The possible
29 amino acid modifications include replacing an amino acid with A, E, F, P, or S. The

1 modifications replace one or more amino acids in the identified regions, without
2 increasing or decreasing the total number of amino acids in the protein.

3 Alternatively, the recombinant vector comprises a structural nucleic acid sequence
4 encoding SEQ ID NO:2 modified by one or more of the following changes or encoding
5 SEQ ID NO:7 modified by one or more of the following changes: the Y corresponding to
6 position 106 of SEQ ID NO:2 or position 87 of SEQ ID NO:7 is replaced with F or A; the
7 I corresponding to position 113 of SEQ ID NO:2 or position 94 of SEQ ID NO:7 is
8 replaced with A; the Y corresponding to position 129 of SEQ ID NO:2 or position 110 of
9 SEQ ID NO:7 is replaced with F or A; the K corresponding to position 137 of SEQ ID
10 NO:2 or position 118 of SEQ ID NO:7 is replaced with A; the S corresponding to
11 position 184 of SEQ ID NO:2 or position 165 of SEQ ID NO:7 is replaced with A; the Y
12 corresponding to position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is
13 replaced with F or A; the A corresponding to position 188 of SEQ ID NO:2 or position
14 169 of SEQ ID NO:7 is replaced with S; the T corresponding to position 192 of SEQ ID
15 NO:2 or position 173 of SEQ ID NO:7 is replaced with A or P; the Y corresponding to
16 position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is replaced with F or A;
17 the K corresponding to position 268 of SEQ ID NO:2 or position 249 of SEQ ID NO:7 is
18 replaced with A or E; the T corresponding to position 269 of SEQ ID NO:2 or position
19 250 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 270 of SEQ ID
20 NO:2 or position 251 of SEQ ID NO:7 is replaced with F or A; the K corresponding to
21 position 273 of SEQ ID NO:2 or position 254 of SEQ ID NO:7 is replaced with A; the K
22 corresponding to position 313 of SEQ ID NO:2 or position 294 of SEQ ID NO:7 is
23 replaced with E; the N corresponding to position 314 of SEQ ID NO:2 or position 295 of
24 SEQ ID NO:7 is replaced with A; the N corresponding to position 315 of SEQ ID NO:2
25 or position 296 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 316
26 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is replaced with F or A; the Y
27 corresponding to position 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is
28 replaced with F; the K corresponding to position 367 of SEQ ID NO:2 or position 348 of
29 SEQ ID NO:7 is replaced with A; the R corresponding to position 368 of SEQ ID NO:2
30 or position 349 of SEQ ID NO:7 is replaced with A; the F corresponding to position 369
31 of SEQ ID NO:2 or position 350 of SEQ ID NO:7 is replaced with A; the K

1 corresponding to position 371 of SEQ ID NO:2 or position 352 of SEQ ID NO:7 is
2 replaced with A; the L corresponding to position 372 of SEQ ID NO:2 or position 353 of
3 SEQ ID NO:7 is replaced with A; and the L corresponding to position 373 of SEQ ID
4 NO:2 or position 354 of SEQ ID NO:7 is replaced with A.

5 More preferably, the vector comprises a structural nucleic acid sequence encoding
6 SEQ ID NO:2 modified by the following changes or SEQ ID NO:7 modified by the
7 following changes: the Y corresponding to position 106 of SEQ ID NO:2 or position 87
8 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 129 of SEQ ID
9 NO:2 or position 110 of SEQ ID NO:7 is replaced with F; the Y corresponding to
10 position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F; the Y
11 corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
12 replaced with F; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
13 SEQ ID NO:7 is replaced with F; the Y corresponding to position 316 of SEQ ID NO:2
14 or position 297 of SEQ ID NO:7 is replaced with F; and the Y corresponding to position
15 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

16 Most preferably, the vector comprises a structural nucleic acid sequence encoding
17 SEQ ID NO:2 modified by the following changes or SEQ ID NO:7 modified by the
18 following changes: the Y corresponding to position 185 of SEQ ID NO:2 or position 166
19 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 193 of SEQ ID
20 NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y corresponding to
21 position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is replaced with F; the Y
22 corresponding to position 316 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is
23 replaced with F; and the Y corresponding to position 362 of SEQ ID NO:2 or position
24 343 of SEQ ID NO:7 is replaced with F.

25 The method can generally be used to prepare any type of recombinant host cell.
26 Preferably, the method can be used to prepare a recombinant bacterial cell, a recombinant
27 fungal cell, or a recombinant plant cell. The bacterial cell is preferably an *Escherichia*
28 *coli* bacterial cell. The fungal cell is preferably a *Saccharomyces cerevisiae*,
29 *Schizosaccharomyces pombe*, or *Pichia pastoris* fungal cell. The plant cell can be a
30 monocot, dicot, or conifer plant cell. The plant cell is preferably an alfalfa, banana,

1 canola, corn, cotton, cucumber, peanut, potato, rice, soybean, sunflower, sweet potato,
2 tobacco, tomato, or wheat plant cell.

3 An additional embodiment is directed towards methods for the preparation of
4 recombinant plants useful for the production of deallergenized patatin proteins. The
5 method can comprise selecting a host plant cell; transforming the host plant cell with a
6 recombinant vector; obtaining recombinant host cells; and regenerating a recombinant
7 plant from the recombinant host plant cells.

8 The recombinant vector comprises a structural nucleic acid sequence encoding
9 SEQ ID NO:2 modified in one or more of the following regions, or SEQ ID NO:7
10 modified in one or more of the following regions. The single or multiple amino acid
11 modifications reduce the binding of the modified protein relative to the binding of the
12 corresponding unmodified protein. The regions for modification include amino acid
13 positions 104-113 of SEQ ID NO:2 (85-94 of SEQ ID NO:7), 128-137 of SEQ ID NO:2
14 (109-118 of SEQ ID NO:7), 184-197 of SEQ ID NO:2 (165-178 of SEQ ID NO:7), 264-
15 277 of SEQ ID NO:2 (245-258 of SEQ ID NO:7), 316-325 of SEQ ID NO:2 (297-306 of
16 SEQ ID NO:7), and 360-377 of SEQ ID NO:2 (341-358 of SEQ ID NO:7). The possible
17 amino acid modifications include replacing an amino acid with A, E, F, P, or S. The
18 modifications replace one or more amino acids in the identified regions, without
19 increasing or decreasing the total number of amino acids in the protein.

20 Alternatively, the recombinant vector comprises a structural nucleic acid sequence
21 encoding SEQ ID NO:2 modified by one or more of the following changes or encoding
22 SEQ ID NO:7 modified by one or more of the following changes: the Y corresponding to
23 position 106 of SEQ ID NO:2 or position 87 of SEQ ID NO:7 is replaced with F or A; the
24 I corresponding to position 113 of SEQ ID NO:2 or position 94 of SEQ ID NO:7 is
25 replaced with A; the Y corresponding to position 129 of SEQ ID NO:2 or position 110 of
26 SEQ ID NO:7 is replaced with F or A; the K corresponding to position 137 of SEQ ID
27 NO:2 or position 118 of SEQ ID NO:7 is replaced with A; the S corresponding to
28 position 184 of SEQ ID NO:2 or position 165 of SEQ ID NO:7 is replaced with A; the Y
29 corresponding to position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is
30 replaced with F or A; the A corresponding to position 188 of SEQ ID NO:2 or position
31 169 of SEQ ID NO:7 is replaced with S; the T corresponding to position 192 of SEQ ID

1 NO:2 or position 173 of SEQ ID NO:7 is replaced with A or P; the Y corresponding to
2 position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is replaced with F or A;
3 the K corresponding to position 268 of SEQ ID NO:2 or position 249 of SEQ ID NO:7 is
4 replaced with A or E; the T corresponding to position 269 of SEQ ID NO:2 or position
5 250 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 270 of SEQ ID
6 NO:2 or position 251 of SEQ ID NO:7 is replaced with F or A; the K corresponding to
7 position 273 of SEQ ID NO:2 or position 254 of SEQ ID NO:7 is replaced with A; the K
8 corresponding to position 313 of SEQ ID NO:2 or position 294 of SEQ ID NO:7 is
9 replaced with E; the N corresponding to position 314 of SEQ ID NO:2 or position 295 of
10 SEQ ID NO:7 is replaced with A; the N corresponding to position 315 of SEQ ID NO:2
11 or position 296 of SEQ ID NO:7 is replaced with A; the Y corresponding to position 316
12 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is replaced with F or A; the Y
13 corresponding to position 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is
14 replaced with F; the K corresponding to position 367 of SEQ ID NO:2 or position 348 of
15 SEQ ID NO:7 is replaced with A; the R corresponding to position 368 of SEQ ID NO:2
16 or position 349 of SEQ ID NO:7 is replaced with A; the F corresponding to position 369
17 of SEQ ID NO:2 or position 350 of SEQ ID NO:7 is replaced with A; the K
18 corresponding to position 371 of SEQ ID NO:2 or position 352 of SEQ ID NO:7 is
19 replaced with A; the L corresponding to position 372 of SEQ ID NO:2 or position 353 of
20 SEQ ID NO:7 is replaced with A; and the L corresponding to position 373 of SEQ ID
21 NO:2 or position 354 of SEQ ID NO:7 is replaced with A.

22 More preferably, the vector comprises a structural nucleic acid sequence encoding
23 SEQ ID NO:2 modified by the following changes or SEQ ID NO:7 modified by the
24 following changes: the Y corresponding to position 106 of SEQ ID NO:2 or position 87
25 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 129 of SEQ ID
26 NO:2 or position 110 of SEQ ID NO:7 is replaced with F; the Y corresponding to
27 position 185 of SEQ ID NO:2 or position 166 of SEQ ID NO:7 is replaced with F; the Y
28 corresponding to position 193 of SEQ ID NO:2 or position 174 of SEQ ID NO:7 is
29 replaced with F; the Y corresponding to position 270 of SEQ ID NO:2 or position 251 of
30 SEQ ID NO:7 is replaced with F; the Y corresponding to position 316 of SEQ ID NO:2

1 or position 297 of SEQ ID NO:7 is replaced with F; and the Y corresponding to position
2 362 of SEQ ID NO:2 or position 343 of SEQ ID NO:7 is replaced with F.

3 Most preferably, the vector comprises a structural nucleic acid sequence encoding
4 SEQ ID NO:2 modified by the following changes or SEQ ID NO:7 modified by the
5 following changes: the Y corresponding to position 185 of SEQ ID NO:2 or position 166
6 of SEQ ID NO:7 is replaced with F; the Y corresponding to position 193 of SEQ ID
7 NO:2 or position 174 of SEQ ID NO:7 is replaced with F; the Y corresponding to
8 position 270 of SEQ ID NO:2 or position 251 of SEQ ID NO:7 is replaced with F; the Y
9 corresponding to position 316 of SEQ ID NO:2 or position 297 of SEQ ID NO:7 is
10 replaced with F; and the Y corresponding to position 362 of SEQ ID NO:2 or position
11 343 of SEQ ID NO:7 is replaced with F.

12 The recombinant plant can generally be any type of plant. The plant can be a
13 monocot, dicot, or conifer plant. The plant is preferably an alfalfa, banana, canola, corn,
14 cotton, cucumber, peanut, potato, rice, soybean, sunflower, sweet potato, tobacco,
15 tomato, or wheat plant.

16 Deallergenized patatin proteins can be prepared by isolating the deallergenized
17 patatin protein from any one of the above described host cells or plants.

18 19 Deglycosylation

20 The examples herein provide evidence that glycosylation of can contribute to the
21 allergenicity of a protein. Accordingly, rational substitution of amino acid residues likely
22 to be the targets of glycosylation within a subject allergen protein may reduce or
23 eliminate the allergenic properties of the protein without adversely affecting the
24 enzymatic, insecticidal, antifungal or other functional properties of the protein.

25 Glycosylation commonly occurs as either N-linked or O-linked forms. N-linked
26 glycosylation usually occurs at the motif Asn-Xaa-Ser/Thr, where Xaa is any amino acid
27 except Pro (Kasturi, L. et al., *Biochem J.* 323: 415-519, 1997; Melquist, J.L. et al.,
28 *Biochemistry* 37: 6833-6837, 1998). O-linked glycosylation occurs between the hydroxyl
29 group of serine or threonine and an amino sugar.

30 Site directed mutagenesis of selected asparagine, serine, or threonine may be used
31 to reduce or eliminate the glycosylation of patatin proteins. A search of SEQ ID NO:2

1 for the Asn-Xaa-Ser/Thr motif reveals one occurrence at amino acid positions 202-204.
2 Mutagenization of the nucleic acid sequence encoding this region may result in a reduced
3 allergenicity of the encoded protein.

4 In order to test this conceptual approach to reducing allergenicity of patatin
5 proteins, two sets of experiments were performed: a) production of patatin proteins in
6 *Escherichia coli*, which do not glycosylate proteins; and b) production of patatin proteins
7 with an N202Q site directed mutation.

8 Antibodies obtained from patients HS-07 and G15-MON (not potato allergic) did
9 not show specific binding to wild type patatin, patatin produced in *E. coli*, or the N202Q
10 variant. Antibodies obtained from patient HS-01 (potato allergic) bound to wild type
11 patatin, but not to patatin produced in *E. coli* or the N202Q variant. Antibodies obtained
12 from patient HS-02 (potato allergic) bound strongly to wild type patatin, but extremely
13 weakly to patatin produced in *E. coli*, and binding to the N202Q variant resembled vector
14 controls. Antibodies obtained from patient HS-03 (potato allergic) bound to wild type
15 patatin, but not to patatin produced in *E. coli* or the N202Q variant. Antibodies obtained
16 from patient HS-05 (potato allergic) bound to wild type patatin, but very weakly to
17 patatin produced in *E. coli* and the N202Q variant. Antibodies obtained from patient HS-
18 06 (potato allergic) strongly bound wild type patatin, the N202Q variant, and to patatin
19 produced in *E. coli*. These results strongly suggest that glycosylation is at least partially
20 responsible for the antigenic properties of patatin proteins, and that site directed
21 mutagenesis may be used to reduce or eliminate specific antibody binding. Mutagenesis
22 at position 202 of SEQ ID NO:2 may be useful for reducing or eliminating specific
23 antibody binding.

24 Permuteins

25 The positions of the internal breakpoints described in the following Examples are
26 found on the protein surface, and are distributed throughout the linear sequence without
27 any obvious bias towards the ends or the middle. Breakpoints occurring below the
28 protein surface can additionally be selected. The rearranged two subunits can be joined
29 by a peptide linker. A preferred embodiment involves the linking of the N-terminal and
30 C-terminal subunits by a three amino acid linker, although linkers of various sizes can be

1 used. Additionally, the N-terminal and C-terminal subunits can be joined lacking a linker
2 sequence. Furthermore, a portion of the C-terminal subunit can be deleted and the
3 connection made from the truncated C-terminal subunit to the original N-terminal subunit
4 and vice versa as previously described (Yang and Schachman, *Proc. Natl. Acad. Sci.*
5 *U.S.A.*, 90: 11980-11984, 1993; Viguera, *et al.*, *Mol. Biol.*, 247: 670-681, 1995;
6 Protasova, *et al.*, *Prot. Eng.*, 7: 1373-1377, 1994).

7 The novel insecticidal proteins of the present invention can be represented by the
8 formula:

10 wherein;

11 a is 0 or 1, and if a is 0, then the permutein does not contain a linker
12 sequence;

13 X^1 is a polypeptide sequence corresponding to amino acids n+1 through J;

14 X^2 is a polypeptide corresponding to amino acids 1 through n;

15 n is an integer ranging from 1 to J-1;

16 J is an integer greater than n+1; and

17 L is a linker.

18 In the formula above, the constituent amino acid residues of the novel insecticidal
19 protein are numbered sequentially 1 through J from the original amino terminus to the
20 original carboxyl terminus. A pair of adjacent amino acids within this protein can be
21 numbered n and n+1 respectively where n is an integer ranging from 1 to J-1. The
22 residue n+1 becomes the new N-terminus of the novel insecticidal protein and the residue
23 n becomes the new C-terminus of the novel insecticidal protein.

24 For example, a parent protein sequence consisting of 120 amino acids can be
25 selected as a starting point for designing a permutein (J=120). If the breakpoint is
26 selected as being between position 40 and position 41, then n=40. If a linker is selected
27 to join the two subunits, the resulting permutein will have the formula: (amino acids 41-
28 120)-L-(amino acids 1-40). If a linker was not used, the resulting permutein will have the
29 formula: (amino acids 41-120)-(amino acids 1-40).

30 The length of the amino acid sequence of the linker can be selected empirically,
31 by using structural information, or by using a combination of the two approaches. When

no structural information is available, a small series of linkers can be made whose length can span a range of 0 to 50 Å and whose sequence is chosen in order to be substantially consistent with surface exposure (Hopp and Woods, *Mol. Immunol.*, 20: 483-489, 1983; Kyte and Doolittle, *J. Mol. Biol.*, 157: 105-132, 1982; Lee and Richards, *J. Mol. Biol.*, 55: 379-400, 1971) and the ability to adopt a conformation which does not significantly affect the overall configuration of the protein (Karplus and Schulz, *Naturwissenschaften*, 72: 212-213, 1985). Assuming an average length of 2.0 to 3.8 Å per residue, this would mean the length to test would be between about 0 to about 30 residues, with 0 to about 15 residues being the preferred range. Accordingly, there are many such sequences that vary in length or composition that can serve as linkers with the primary consideration being that they be neither excessively long nor excessively short (Sandhu, *et al.*, *Critical Rev. Biotech.*, 12: 437-467, 1992). If the linker is too long, entropy effects may destabilize the three-dimensional fold and may affect protein folding. If the linker is too short, it may destabilize the molecule due to torsional or steric strain.

Use of the distance between the chain ends, defined as the distance between the C-alpha carbons, can be used to define the length of the sequence to be used, or at least to limit the number of possibilities that can be tested in an empirical selection of linkers. Using the calculated length as a guide, linkers with a range of number of residues (calculated using 2 to 3.8 Å per residue) can be selected. These linkers can be composed of the original sequence, shortened or lengthened as necessary, and when lengthened the additional residues can be chosen to be flexible and hydrophilic as described above; or optionally the original sequence can be substituted for using a series of linkers, one example being Gly-Pro-Gly (SEQ ID NO:277); or optionally a combination of the original sequence and new sequence having the appropriate total length can be used. An alternative short, flexible linker sequence is Gly-Gly-Gly-Ser-Gly-Gly-Gly (SEQ ID NO:276).

Selection of permutein breakpoints

Sequences of novel patatin analogs capable of folding to biologically active molecules can be prepared by appropriate selection of the beginning (amino terminus) and ending (carboxyl terminus) positions from within the original polypeptide chain

1 while optionally using a linker sequence as described above. Amino and carboxyl
2 termini can be selected from within a common stretch of sequence, referred to as a
3 breakpoint region, using the guidelines described below. A novel amino acid sequence is
4 thus generated by selecting amino and carboxyl termini from within the same breakpoint
5 region. In many cases, the selection of the new termini will be such that the original
6 position of the carboxyl terminus immediately preceded that of the amino terminus.
7 However, selections of termini anywhere within the region may result in a functional
8 protein, and that these will effectively lead to either deletions or additions to the amino or
9 carboxyl portions of the new sequence.

10 The primary amino acid sequence of a protein dictates folding to the three-
11 dimensional structure beneficial for expression of its biological function. It is possible to
12 obtain and interpret three-dimensional structural information using x-ray diffraction of
13 single protein crystals or nuclear magnetic resonance spectroscopy of protein solutions.
14 Examples of structural information that are relevant to the identification of breakpoint
15 regions include the location and type of protein secondary structure (alpha and 3-10
16 helices, parallel and anti-parallel beta sheets, chain reversals and turns, and loops
17 (Kabsch and Sander, *Biopolymers*, 22: 2577-2637, 1983), the degree of solvent exposure
18 of amino acid residues, the extent and type of interactions of residues with one another
19 (Chothia, C., *Ann. Rev. Biochem.*, 53: 537-572, 1984), and the static and dynamic
20 distribution of conformations along the polypeptide chain (Alber and Mathews, *Methods*
21 *Enzymol.*, 154: 511-533, 1987). In some cases additional information is known about
22 solvent exposure of residues, one example is a site of post-translational attachment of
23 carbohydrate which is necessarily on the surface of the protein. When experimental
24 structural information is not available, or when it is not feasible to obtain the information,
25 methods are available to analyze the primary amino acid sequence in order to make
26 predictions of protein secondary and tertiary structure, solvent accessibility and the
27 occurrence of turns and loops (Fasman, G., Ed. Plenum, New York, 1989; Robson, B.
28 and Garnier, J. *Nature* 361: 506, 1993).

29 Biochemical methods can be applicable for empirically determining surface
30 exposure when direct structural methods are not feasible; for example, using the
31 identification of sites of chain scission following limited proteolysis in order to infer

1 surface exposure (Gentile, F. and Salvatore, G., *Eur. J. Biochem.*, 218: 603-621, 1993).
2 Thus, using either the experimentally derived structural information or predictive
3 methods (Srinivasan, R. and Rose, G.D. *Proteins*, 22: 81-99, 1995), the parental amino
4 acid sequence can be analyzed to classify regions according to whether or not they are
5 integral to the maintenance of secondary and tertiary structure. The sequences within
6 regions that are known to be involved in periodic secondary structure (alpha and 3-10
7 helices, parallel and anti-parallel beta sheets) are regions that should be avoided.
8 Similarly, regions of amino acid sequence that are observed or predicted to have a low
9 degree of solvent exposure are more likely to be part of the so-called hydrophobic core of
10 the protein and should also be avoided for selection of amino and carboxyl termini.
11 Regions that are known or predicted to be in surface turns or loops, and especially those
12 regions that are known not to be required for biological activity, can be preferred sites for
13 new amino and carboxyl termini. Stretches of amino acid sequence that are preferred
14 based on the above criteria can be selected as breakpoint regions.

15 An embodiment of the invention is directed towards patatin permutein proteins.
16 The permutein proteins preferably maintain esterase activity and insecticidal properties.
17 The permutein proteins preferably are less allergenic than the wild type patatin protein to
18 individuals or animals allergic to potatoes. This can be assayed by the binding of
19 antibodies to the wild type patatin and patatin permutein proteins.

20 The permutein proteins can optionally contain a linker sequence. The linker can
21 generally be any amino acid sequence, preferably is Gly-Gly-Gly-Ser-Gly-Gly-Gly (SEQ
22 ID NO:276) or Gly-Pro-Gly (SEQ ID NO:277), and more preferably is Gly-Pro-Gly
23 (SEQ ID NO:277). Specific permutein proteins comprise: (amino acids 247-386 of SEQ
24 ID NO:2)-linker-(amino acids 24-246 of SEQ ID NO:2), (amino acids 269-386 of SEQ
25 ID NO:2)-linker-(amino acids 24-268 of SEQ ID NO:2), SEQ ID NO:247, and SEQ ID
26 NO:259.

27 Embodiments of the invention also include isolated nucleic acid molecule
28 segments comprising a structural nucleic acid sequence encoding a patatin permutein
29 protein. The encoded permutein protein can generally be any permutein protein, and
30 preferably comprises (amino acids 247-386 of SEQ ID NO:2)-linker-(amino acids 24-246
31 of SEQ ID NO:2), (amino acids 269-386 of SEQ ID NO:2)-linker-(amino acids 24-268 of

1 SEQ ID NO:2), SEQ ID NO:247, or SEQ ID NO:259. The linker can generally be any
2 amino acid sequence, preferably is Gly-Gly-Gly-Ser-Gly-Gly-Gly (SEQ ID NO:276) or
3 Gly-Pro-Gly (SEQ ID NO:277), and more preferably is Gly-Pro-Gly (SEQ ID NO:277).
4 Alternatively, the encoded patatin permutein protein can lack a linker sequence. The
5 structural nucleic acid sequence is preferably SEQ ID NO:246 or SEQ ID NO:258.

6 An embodiment of the invention is directed towards recombinant vectors which
7 encode a patatin permutein protein. The vector can comprise operatively linked in the 5'
8 to 3' orientation: a promoter that directs transcription of a structural nucleic acid
9 sequence; a structural nucleic acid sequence encoding a protein selected from the group
10 consisting of: (amino acids 247-386 of SEQ ID NO:2)-linker-(amino acids 24-246 of
11 SEQ ID NO:2); and (amino acids 269-386 of SEQ ID NO:2)-linker-(amino acids 24-268
12 of SEQ ID NO:2); and a 3' transcription terminator. The linker can comprise Gly-Pro-
13 Gly (SEQ ID NO:277) or Gly-Gly-Gly-Ser-Gly-Gly-Gly (SEQ ID NO:276).
14 Alternatively, the encoded patatin permutein protein can lack a linker sequence. The
15 structural nucleic acid sequence can preferably be SEQ ID NO:246 or SEQ ID NO:258,
16 and preferably encodes SEQ ID NO:247 or SEQ ID NO:259.

17 An additional embodiment of the invention is directed towards recombinant host
18 cells useful for the production of a patatin permutein protein. The recombinant host cell
19 preferably produces a patatin permutein protein. More preferably, the recombinant host
20 cell produces a patatin permutein protein in a concentration sufficient to inhibit growth or
21 to kill an insect which ingests the recombinant host cell. The recombinant host cell can
22 comprise a structural nucleic acid sequence encoding a protein selected from the group
23 consisting of: (amino acids 247-386 of SEQ ID NO:2)-linker-(amino acids 24-246 of
24 SEQ ID NO:2); and (amino acids 269-386 of SEQ ID NO:2)-linker-(amino acids 24-268
25 of SEQ ID NO:2). The linker can generally be any amino acid sequence, and preferably
26 is Gly-Pro-Gly (SEQ ID NO:277) or Gly-Gly-Gly-Ser-Gly-Gly-Gly (SEQ ID NO:276).
27 Alternatively, the encoded patatin permutein protein can lack a linker sequence. The
28 structural nucleic acid sequence is preferably SEQ ID NO:246 or SEQ ID NO:258, and
29 preferably encodes SEQ ID NO:247 or SEQ ID NO:259. The structural nucleic acid
30 sequence can be operatively linked to a promoter sequence that directs transcription of
31 the structural nucleic acid sequence, a 3' transcription terminator, and a 3'

polyadenylation signal sequence. The recombinant host cell can generally be any type of host cell, and preferably is a bacterial, fungal, or plant host cell. The bacterial cell is preferably an *Escherichia coli* bacterial cell. The fungal cell is preferably a *Saccharomyces cerevisiae*, *Schizosaccharomyces pombe*, or *Pichia pastoris* fungal cell. The plant cell can be a monocot, dicot, or conifer plant cell. The plant cell is preferably an alfalfa, banana, canola, corn, cotton, cucumber, peanut, potato, rice, soybean, sunflower, sweet potato, tobacco, tomato, or wheat plant cell.

An additional embodiment of the invention is directed towards recombinant plants which are useful for the production of patatin permutein proteins. The recombinant plant preferably produces a patatin permutein protein. More preferably, the recombinant plant produces a patatin permutein protein in a concentration sufficient to inhibit growth or to kill an insect which ingests tissue from the recombinant plant. The recombinant plant can comprise a structural nucleic acid sequence encoding a protein selected from the group consisting of: (amino acids 247-386 of SEQ ID NO:2)-linker-(amino acids 24-246 of SEQ ID NO:2); and (amino acids 269-386 of SEQ ID NO:2)-linker-(amino acids 24-268 of SEQ ID NO:2). The linker can comprise Gly-Pro-Gly (SEQ ID NO:277) or Gly-Gly-Gly-Ser-Gly-Gly-Gly (SEQ ID NO:276). Alternatively, the encoded protein can lack a linker sequence. The structural nucleic acid sequence is preferably SEQ ID NO:246 or SEQ ID NO:258, and preferably encodes SEQ ID NO:247 or SEQ ID NO:259. The structural nucleic acid sequence can be operatively linked to a promoter sequence that directs transcription of the structural nucleic acid sequence, a 3' transcription terminator, and a 3' polyadenylation signal sequence. The recombinant plant can generally be any type of plant, and preferably is an alfalfa, banana, canola, corn, cotton, cucumber, peanut, potato, rice, soybean, sunflower, sweet potato, tobacco, tomato, or wheat plant.

Permutein proteins can be prepared by isolating the permutein protein from any one of the above described host cells or plants.

Immunotherapy for potato allergy

Immunotherapy for food allergy has been largely unsuccessful due to the lack of appropriate therapeutic reagents (Sampson, H.A., *J. Allergy Clin. Immunol.*, 90(2): 151-152, 1992). Immunotherapy has typically involved the administration (orally or by

1 subcutaneous injections) of increasing doses of crude protein extracts of the offending
2 allergenic entities which usually contain variable mixes of many different proteins
3 (Scheiner, O., *Wien Klin Wochenschr.*, 105(22): 653-658, 1993). While there are reports
4 of highly successful clinical applications of immunotherapy for food allergens (Romano,
5 P.C., *et al.*, *Allergol. Immunopathol. (Madr)*, 12(4): 275-281, 1984), those reports are rare
6 and the clinical literature in general recommends avoidance far more strongly than
7 therapy (Gay, G., *Allerg. Immunol. (Paris)*, 29(6): 169-170, 1997). One of the primary
8 reasons for the failure of many clinical attempts to induce tolerance to allergens in
9 general and food allergens in particular relates to anecdotal comments by numerous
10 allergists, that patients don't tolerate the doses of allergen required to achieve tolerance.
11 Animal studies examining the relationship of antigen dose and the induction of tolerance
12 have demonstrated a strong positive correlation (Chen, Y., *et al.*, *Proc. Natl. Acad. Sci.*,
13 *U.S.A.*, 93: 388-391, 1996; Tokai, T., *et al.*, *Nat. Biotechnol.*, 15(8): 754-758, 1997). Due
14 to the very real possibility of inducing an anaphylactic reaction in patients with native
15 allergen, most clinical therapists are quite hesitant to use high doses therapeutically and
16 are therefore compromising the likelihood of successful therapy.

17 In recent reports, recombinant technology has been used to reduce the allergenic
18 potential of a major allergen without modifying the T cell epitopes, and allowing higher
19 doses of protein to be used in therapy (Tokai, T., *et al.*, *Nat. Biotechnol.*, 15(8): 754-758,
20 1997). In addition, a lack of understanding about the appropriate route of administration,
21 the uncertainty of mechanisms responsible for induction of allergy and the uncertainty of
22 mechanisms by which immunotherapy suppresses or blocks the T cell-IgE-
23 eosinophil/mast cell cycle have contributed to the large number of equivocal studies and
24 clinical trials. Recent studies in animal models dealing with mechanisms, routes of
25 administration, adjuvants and vaccine formulations have increased the likelihood that
26 immunotherapy for allergies, including food allergies, will become a reproducibly
27 successful clinical treatment when the appropriate therapeutic reagents are available
28 (Sampson, H.A. and Burks, A.W., *Annu. Rev. Nutr.*, 16: 161-177, 1996; Kaminogawa, S.,
29 *Biosci. Biotechnol. Biochem.*, 60(11): 1749-1756, 1996; Chapman, M.D., *et al.*, *Allergy*,
30 52: 374-379, 1997; Barbeau, W.E., *Adv. Exp. Med. Biol.*, 415: 183-193, 1997; Cao, Y., *et*

Relative to immunotherapy, the critical aspects of the modified patatin genes
 described in this patent are that they can be used to synthesize purified, deallergenized-
 protein which can be used for patatin (potato) specific immunotherapy, with reduced
 potential for adverse and potentially fatal anaphylactic reactions in human or veterinary
 patients who have allergies to patatin or potatoes. Various strategies, including fixing or
 cross linking allergens, encapsulation of allergen for oral delivery, the use of small, T-cell
 epitope peptides and most recently, the use of engineered recombinant proteins, or
 modified gene vaccines are being tested in attempts to decrease the potential for
 anaphylactic reactions while inducing tolerance (Cao, Y., *et al.*, *Immunology*, 90(1): 46-
 51, 1997; Chapman, M.D., *et al.*, *Allergy*, 52: 374-379, 1997; Chapman, M.D., *et al.*, *Int.*

 1996).

1 The instant invention uses an engineered patatin protein, as expressed in any
2 living cell, with or without post-synthesis modifications, for immunotherapy by the
3 routes of cutaneous or subcutaneous exposure, injection, or by oral, gastro-intestinal,
4 respiratory or nasal application, either with, or without the use of specific carriers,
5 vehicles and adjuvants. The direct application of nucleic acid encoding recombinant
6 patatin as the *in vivo* (in the patient) expression template (gene) as RNA-, DNA- or gene-
7 vaccines is also the intended use of the engineered genetic materials defined here, coding
8 for patatin, but with modified IgE binding sites. It is also the intent of this patent to cover
9 the use of these modified genes described here including insertion into various DNA
10 vectors including adenovirus, retrovirus, pox virus and replicating or non-replicating
11 eukaryotic expression plasmids (Lee, D.J., *et al.*, *Int. Arch. Allergy Immunol.*, 113(1-3):
12 227-230, 1997) with various promoters and regulatory sequences, which can be inserted
13 into the patient's somatic cells (dendritic cells, epithelial cells, muscle fiber-cells,
14 fibroblasts, etc.) for the purpose of expressing the recombinant gene product to alter the
15 patient's immune response to the patatin proteins (Lee D.J., *et al.*, *Int. Arch. Allergy*
16 *Immunol.*, 113(1-3): 227-230, 1997). Potential routes of administration foreseen in this
17 application include previously described methods of encapsulation, emulsion, receptor or
18 membrane fusion mediated uptake and methods of direct permeabilization or insertion of
19 the DNA or corresponding RNA into the host cells.

20 The following examples are included to demonstrate preferred embodiments of
21 the invention. It should be appreciated by those of skill in the art that the techniques
22 disclosed in the examples which follow represent techniques discovered by the inventors
23 to function well in the practice of the invention, and thus can be considered to constitute
24 preferred modes for its practice. However, those of skill in the art should, in light of the
25 present disclosure, appreciate that many changes can be made in the specific
26 embodiments which are disclosed and still obtain a like or similar result without
27 departing from the spirit and scope of the invention.

EXAMPLES

Example 1: Identification of patatin as an allergen

Since patatin is commonly obtained from an allergenic source (potato), it was hypothesized that patatins in fact encode an important class of offending potato allergens (patatin was reported as allergenic by Seppala, U. et al., *J. Allergy Clin. Immunol.* 103: 165-171, 1999). Assessment of potential allergens preferably include appropriate *in vitro* testing for IgE binding, in this case with potato allergic sera (Fuchs, R.L. and Astwood, J.D., *Food Technology*, 50: 83-88, 1996; Astwood, J.D., et al., *Monographs in allergy Vol. 32: Highlights in food allergy*, pp. 105-120, 1996, Metcalfe, D.D., et al., *Critical Reviews in Food Science and Nutrition*, 36S: 165-186, 1996). It is the recommendation of a working group organized by the IFBC and the ILSI Allergy and Immunology Institute that proteins encoded by nucleic acid sequences from allergenic sources such as potato (a “less-commonly” allergenic source) should be examined for their ability to react with IgEs of potato-allergic patients using a minimum of five individual patient sera (Metcalfe, D.D., et al., *Critical Reviews in Food Science and Nutrition*, 36S: 165-186, 1996). Patatin-17 protein was tested for IgE binding using standard *in vitro* testing with serum taken from patients with bona fide well defined clinically displayed potato allergy as described below.

Clinical Characterization of Potato Allergic Subjects (Serum donors)

Patients who suffer from potato allergy were identified at Johns Hopkins Clinic (Baltimore, MD) and were evaluated for potato allergy using clinical criteria outlined in Table 2.

Serum was obtained from patients with convincing clinical history of potato allergy. The convincing history was defined as being one or more of the following: a) positive potato allergic as evaluated by double-blind placebo-control food challenge b) anaphylaxis and/or hospitalization due to the consumption of potatoes or c) dramatic skin test results.

Table 2: Clinical patient data

| Patient | Clinical History | Flare/Wheal (Skin prick test) | DBPCFC (potato) |
|---------|--|---|-----------------|
| HS01 | Most recent hospitalization: 10/19/93 AD, A, AR, FH, MFS, IgE =1397 KIAUa/L | 7/19, 4/14, 7/17 | Not performed |
| HS02 | Most recent hospitalization: 6/94 AD, FH, Latex (+) RAST, MFS, IgE=7544K/L | 20/26 | Not performed |
| HS03 | Most recent hospitalization: 7/27/95 AD, A, FH, MFS, IgE = N/A | 5/13 | Yes |
| HS05 | Most recent hospitalization 5/30/95 AD, A, FH, MFS, IgE = 12341 ng/ml | 4/9 | Yes |
| HS06 | Most recent hospitalization 6/13/95 AD, A FH, MFS IgE = N/A | 5/20, 4/13, 5/12 | Yes |
| HS07 | Not potato allergic, allergic to egg, milk, peanuts, seafood. AD, A, AR, FH, MFS | High IgE control serum, not allergic to potato. | |
| HS08 | Non-atopic (normal) | Low IgE control serum | |

AD= Atopic dermatitis; FH= Food hypersensitivity; AR = Allergic rhinitis; A= Asthma; MFS= Multiple food sensitivity; N/A = not available.

Example 2: Western blotting of patatin proteins

Western blotting experiments were performed using patatin protein purified to near homogeneity from corn plants genetically engineered to produce patatin, patatin producing crude genetically engineered corn leaf extracts, crude potato tuber extracts, and non-transgenic corn leaf samples.

Protein samples were electrophoresed by SDS-PAGE (Laemmli, U.K., *Nature* 227: 680-685, 1970) and were electroblotted onto nitrocellulose. Protein blots were processed by standard Western blotting (immunoblotting) techniques and were incubated in potato allergic serum diluted 1:5 in PBS buffer for 1 hour. After washing the blots 3 times with PBS, the blots were incubated in biotinylated anti-IgE (Johns Hopkins Hospital, Baltimore, MD) for 1 hour, followed by a 30 minute incubation in HRP-linked avidin(Promega, New York, NY). IgE-reactive protein bands were visualized by DAB staining (3,3 diaminobenzidine). The blots were dried and photographed. Individual

blots are labeled according to patient serum used. As a control, one blot was incubated in anti-IgE only.

Patatins were shown to be an allergen of potato by examining the reactivity of purified patatin to sera obtained from patients allergic to potato. Sera from five potato allergic subjects were tested by Western blotting techniques. All five sera reacted with purified patatin protein.

Patatin isozymes (SEQ ID NOS:278-282, Figure 1) were tested for IgE binding by Western blotting. Isozymes of patatin were cloned into a yeast expression system and purified prior to analysis. The isozymes were subjected to IgE western blotting as described above with the exception that all five patient sera were pooled. The resulting Western blot of the yeast-expressed isozymes showed that all five isozymes bound IgE in a manner similar to patatin 17, and that all isozymes of patatin tested are also allergens.

Example 3: Western blotting of patatin proteins

Eighty-nine 10-mer peptides were synthesized using the Genosys SPOTs system, each consecutive 10-mer overlapping by 6 amino acids based on the amino acid sequence of patatin 17 (SEQ ID NO:2). The peptides were evaluated for IgE binding with five different potato allergic patient sera using the same incubation procedures as described above. The results are summarized graphically in Figure 2, showing major and minor allergenic epitopes. Interestingly, many of the immunogenic epitopes contain tyrosine. The peptide numbers, sequences, and immunoreactivity is detailed in Table 3.

Table 3: Peptide scan of patatin 17

| Peptide # (SEQ ID NO) | Peptide Sequence | HS01 | HS02 | HS03 | HS05 | HS06 | Cumulative Total |

Example 4: Identification of result effective substitutions

For each major and several minor allergenic epitopes of patatin, result effective substitutions were identified by synthesizing peptides that were altered by individually substituting an alanine residue at each non-alanine position in the epitope. Similarly, the reported nucleic acid sequence encoding corn patatin (U.S. Patent No. 5,882,668; clone 5c9) was evaluated for IgE binding by producing peptides at corresponding positions to the potato patatin protein.

For example, Epitope 41 was analyzed by alanine scanning and rational substitution as follows.

Epitope 41 SEFDKTYTAK (SEQ ID NO:76)

Alanine scan AEFDKTYTAK (SEQ ID NO:165)

1 SAFDKTYTAK (SEQ ID NO:166)
2 SEADKTYTAK (SEQ ID NO:167)
3 SEFAKTYTAK (SEQ ID NO:168)
4 SEFDATYTAK (SEQ ID NO:169)
5 SEFDKAYTAK (SEQ ID NO:170)
6 SEFDKTATAK (SEQ ID NO:171)
7 SEFDKTYAAK (SEQ ID NO:172)
8 SEFDKTYTAA (SEQ ID NO:173)
9 Rational substitution AFFDKTYTAK (SEQ ID NO:283)
10 SEFDKTFTAK (SEQ ID NO:176)
11 Corn homolog CIFDSTYTAK (SEQ ID NO:284)

12
13 Selected epitopes were analyzed by alanine scanning and rational substitution.
14 Immunoassay with potato-allergic serum was used as described above. Table 4
15 summarizes the results of these experiments to identify result effective substitutions for
16 patatin. Blank spaces in the table indicate that binding of the peptide to patient IgE was
17 not detectable.

18 Table 4: Scanning of patatin for result effective substitutions

1

2 Result effective substitutions were identified by a reduction in IgE binding ability
3 with respect to the non-substituted peptide sequence. Table 5 shows the identified result
4 effective substitutions. Blank spaces in the table indicate that binding of the peptide to
5 patient IgE was not detectable. Many substitutions of alanine or phenylalanine for the
6 original tyrosine resulted in reduced or eliminated antibody binding.

7

1 (r) = rational; (c) = corn.

2 Example 5: Site directed mutagenesis

3 To introduce site specific mutations, the cloned DNA sequence of patatin (SEQ
4 ID NO:1 encoding patatin protein SEQ ID NO:2; pMON 26820) was subjected to PCR
5 with primers SEQ ID NO:3 and SEQ ID NO:4 to incorporate part of the α -factor signal
6 sequence (*Pichia* expression manual, Invitrogen, Carlsbad, CA), and EcoRI and XhoI
7 restriction sites to facilitate cloning into the *Pichia pastoris* yeast secretion vector pPIC9
8 (GenBank accession number Z46233; Invitrogen, Carlsbad, CA). Typical PCR

1 conditions are 25 cycles 94°C denaturation for 1 minute, 45°C annealing for one minute
2 and 72°C extension for 2 minutes; plus one cycle 72°C extension for 10 minutes. A 50
3 µL reaction contains 30 pmol of each primer and 1 µg of template DNA; and 1 X PCR
4 buffer with MgCl₂, 200 µM dGTP, 200 µM dATP, 200 µM dTTP, 200 µM dCTP, 2.5
5 units of *Pwo* DNA polymerase. PCR reactions are performed in RoboCycler Gradient 96
6 Temperature Cycler (Stratagene, La Jolla, CA).

7 The amplified fragment SEQ ID NO:5 was digested with restriction enzymes
8 XhoI and EcoRI and cloned into the pBluescript vector (Stratagene, La Jolla, CA),
9 digested with the same two restriction enzymes. The resulting plasmid (pMON 26869)
10 was used for oligonucleotide-directed mutagenesis using the Bio-Rad mutagenesis kit
11 based on the method of Kunkel (*Proc. Natl. Acad. Sci. U.S.A.*, 82: 477-492, 1985).
12 Briefly, single-stranded pMON26869 was used as template for mutagenesis and was
13 prepared by superinfection of plasmid containing cells with M13K07 (Gorman, *et al.*,
14 *DNA Prot. Eng. Techniques*, 2: 3-10, 1990). The mutagenic oligonucleotides are SEQ ID
15 NOS:8-15 (reverse complement). DNA purified from transformed DH5α *E. coli* colonies
16 was used for sequence determination. Sequencing was performed using the ABI PRISM
17 sequencing kit (Perkin Elmer Biosystems, Foster City, CA). The resulting plasmid
18 containing the mutation in the patatin gene was digested with restriction enzymes XhoI
19 and EcoRI.

20 The patatin nucleic acid fragment was then ligated into the pPIC9 vector
21 (Invitrogen, Carlsbad, CA), digested with the same two restriction enzymes to afford
22 plasmid pMON37401. *Pichia pastoris* KM71 cells were electroporated with
23 pMON37401 containing the appropriate mutation. The resulting transformed cells were
24 used to produce protein in *Pichia pastoris* using the procedure supplied by the
25 manufacturer (Invitrogen, Carlsbad, CA). The encoded protein contains an alpha factor
26 signal cleavage site. Plasmid pMON37401 encodes SEQ ID NO:6 which is cleaved to
27 afford SEQ ID NO:7, having four amino acids added at the N-terminus of amino acids
28 24-386 of SEQ ID NO:2. Position four of SEQ ID NO:7 therefore corresponds to
29 position 23 of SEQ ID NO:2.

30 The concentration of patatin in the culture was determined using a patatin ELISA
31 assay and the enzyme activity was measured using the method of Hofgen and Willmitzer

1 (Plant Science, 66: 221-230, 1990). The variants containing multiple mutations were
 2 further purified using Mono Q and hydrophobic interaction chromatography (HIC). Each
 3 culture was purified by first sizing on Amicon YM10 membranes (Millipore, Bedford,
 4 MA) to a >10 kDa fraction, followed by chromatography on the Mono Q HR 10/10
 5 column (Pharmacia, Piscataway, NJ). For chromatography on the Mono Q column, the
 6 samples were loaded on the column in 25 mM Tris pH 7.5 and eluted with a gradient of
 7 1.0 M KCl in 25 mM Tris pH 7.5. Fractions containing patatin protein were determined
 8 using SDS-PAGE. For chromatography on the HIC column, the appropriate fractions
 9 were pooled and dialyzed into 1 M ammonium sulfate in 25 mM Tris pH 7.5. The
 10 dialyzed sample was then loaded on 16/10 phenyl Sepharose column (Pharmacia,
 11 Piscataway, NJ) and eluted with a gradient of 25 mM Tris pH7.5.

12 The protein concentration was determined using the Bradford method, using BSA
 13 as a standard. SDS-PAGE analysis showed that these proteins were essentially pure. The
 14 esterase activity of the newly formed variants are shown in Table 6. The activity was
 15 determined using p-nitrophenyl caprate substrate as described by Hofgen and Willmitzer
 16 (Plant Science, 66: 221-230, 1990).

17 Table 6: Esterase activity of patatin mutants

| Variant | Activity (mOD.min ⁻¹ μg ⁻¹) |
|---|--|
| Wild type | 93.2 |
| Y106F | 51.1 |
| Y129F | 74.7 |
| Y185F | 85.6 |
| Y193F | 82.2 |
| Y185F/Y193F | 99.4 |
| Y270F | 163.4 |
| Y316F | 94.88 |
| Y362F | 130.7 |
| Y106F/Y129F/Y185F/Y193F/Y270F/Y316F/Y362F | 57.1 |
| Y185F/Y193F/Y270F/Y316F/Y362F | 161.5 |

18
 19 Patatin proteins having a phenylalanine substitution at each of the amino acid
 20 positions 106, 129, 185, 193, 270, 316 and 362 (numbers correspond to positions in SEQ

1 ID NO:2) of expressed SEQ ID NO:7 exhibit full enzyme activity. Proteins having
2 multiple substitutions also displayed full enzyme activity.

3 In addition to nucleotide sequences encoding conservative amino acid changes
4 within the fundamental polypeptide sequence, biologically functional equivalent
5 nucleotide sequences include nucleotide sequences containing other base substitutions,
6 additions, or deletions. These include nucleic acids containing the same inherent genetic
7 information as that contained in the cDNA which encode peptides, polypeptides, or
8 proteins conferring pathogen resistance the same as or similar to that of pathogen upon
9 host cells and plants. Such nucleotide sequences can be referred to as “genetically
10 equivalent modified forms” of the cDNA, and can be identified by the methods
11 described herein.

12 Mutations made in the cDNA, plasmid DNA, genomic DNA, synthetic DNA, or
13 other nucleic acid encoding the deallergenized gene preferably preserve the reading
14 frame of the coding sequence. Furthermore, these mutations preferably do not create
15 complementary regions that could hybridize to produce secondary mRNA structures,
16 such as loops or hairpins, that would adversely affect mRNA translation.

17 Although mutation sites can be predetermined, it is not necessary that the nature
18 of the mutations *per se* be predetermined. For example, in order to select for optimum
19 characteristics of mutants at a given site, random mutagenesis can be conducted at the
20 target codon.

21 Alternatively, mutations can be introduced at particular loci by synthesizing
22 oligonucleotides containing a mutant sequence, flanked by restriction sites enabling
23 ligation to fragments of the native cDNA sequence. Following ligation, the resulting
24 reconstructed nucleotide sequence encodes a derivative form having the desired amino
25 acid insertion, substitution, or deletion.

26 Example 6: Construction of permutein sequences

27 Nucleic acid sequences encoding permutein proteins having rearranged N-
28 terminus/C-terminus protein sequences can be made by following the general method
29 described by Mullins et al. (*J. Am. Chem. Soc.* 116: 5529-5533, 1994). The steps are
30 shown in Figure 3. The Figure and the following Examples involve the design and use of

1 a linker region separating the original C-terminus and N-terminus, but the use of a linker
2 is not a critical or required element of permutein design.

3 Two sets of oligonucleotide primers are used in the construction of a nucleic acid
4 sequence encoding a permutein protein. In the first step, oligonucleotide primers “new
5 N-termini” and “linker start” are used in a PCR reaction to create amplified nucleic acid
6 molecule “new N-termini fragment” that contains the nucleic acid sequence encoding the
7 new N-terminal portion of the permutein protein, followed by the polypeptide linker that
8 connects the C-terminal and N-terminal ends of the original protein. In the second step,
9 oligonucleotide primers “new C-termini” and “linker end” are used in a PCR reaction to
10 create amplified nucleic acid molecule “new C-termini fragment” that contains the
11 nucleic acid sequence encoding the same linker as used above, followed by the new C-
12 termini portion of the permutein protein. The “new N-termini” and “new C-termini”
13 oligonucleotide primers are designed to include appropriate restriction enzyme
14 recognition sites which assist in the cloning of the nucleic acid sequence encoding the
15 permutein protein into plasmids.

16 Any suitable PCR conditions and polymerase can be used. It is desirable to use a
17 thermostable DNA polymerase with high fidelity to reduce or eliminate the introduction
18 of sequence errors. Typical PCR conditions are 25 cycles 94°C denaturation for 1
19 minute, 45°C annealing for one minute and 72°C extension for 2 minutes; plus one cycle
20 72°C extension for 10 minutes. A 50 µL reaction contains 30 pmol of each primer and 1
21 µg of template DNA; and 1 X PCR buffer with MgCl₂, 200 µM dGTP, 200 µM dATP,
22 200 µM dTTP, 200 µM dCTP, 2.5 units of *Pwo* DNA polymerase. PCR reactions are
23 performed in RoboCycler Gradient 96 Temperature Cycler (Stratagene, La Jolla, CA).

24 The amplified “new N-termini fragment” and “new C-termini fragment” are
25 annealed to form a template in a third PCR reaction to amplify the full-length nucleic
26 acid sequence encoding the permutein protein. The DNA fragments “new N-termini
27 fragment” and “new C-termini fragment” are resolved on a 1% TAE gel, stained with
28 ethidium bromide, and isolated using the QIAquick Gel Extraction Kit (Qiagen, Valencia,
29 CA). These fragments are combined in equimolar quantities with oligonucleotide
30 primers “new N-termini” and “new C-termini” in the third PCR reaction. The conditions

1 for the PCR are the same as used previously. PCR reaction products can be purified
2 using the QIAquick PCR purification kit (Qiagen, Valencia, CA).

3 Alternatively, a linker sequence can be designed containing a restriction site,
4 allowing direct ligation of the two amplified PCR products.

5 Example 7: Construction of plasmid pMON 37402

6 The patatin protein contains a trypsin protease sensitive site at the arginine amino
7 acid at position 246, as determined by electrophoresis of a trypsin digest reaction. In
8 order to determine if the exposed protease site is an antigenic epitope, a permutein was
9 constructed using positions 246-247 as a breakpoint.

10 The nucleic acid sequence encoding the permutein protein in plasmid pMON
11 37402 was created using the method illustrated in Figure 3 and described in Example 6.
12 Nucleic acid molecule "new N-termini fragment" was created and amplified from the
13 sequence encoding patatin in plasmid pMON26820 using oligonucleotide primers 27
14 (SEQ ID NO:242) and 48 (SEQ ID NO:243). Nucleic acid molecule "new C-termini
15 fragment" was created and amplified from the sequence encoding patatin in plasmid
16 pMON26820 using oligonucleotide primers 47 (SEQ ID NO:244) and 36 (SEQ ID
17 NO:245). The full-length nucleic acid molecule encoding the permutein protein was
18 created and amplified from annealed fragments "new N-termini fragment" and "new C-
19 termini fragment" using oligonucleotide primers 27 (SEQ ID NO:242) and 36 (SEQ ID
20 NO:245).

21 The resulting amplified nucleic acid molecule was digested with restriction
22 endonucleases XhoI and EcoRI, and purified using the QIAquick PCR purification kit
23 (Qiagen, Valencia, CA). Plasmid pMON 26869 (derivative of pPIC9, Invitrogen,
24 Carlsbad, CA) was digested with restriction endonucleases XhoI and EcoRI, and gel
25 purified, resulting in an approximately 2900 base pair vector fragment. The purified
26 restriction fragments were combined and ligated using T4 DNA ligase.

27 The ligation reaction mixture was used to transform *E. coli* strain DH5α cells
28 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
29 ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the

1 presence of the correct insert. The resulting plasmid was designated pMON 37402
2 (containing SEQ ID NO:246, encoding protein sequence SEQ ID NO:247).

3 Example 8: Construction of plasmid pMON 37405

4 Amino acids 201-202, near tyrosine 193, were chosen as a breakpoint for the
5 construction of a permutein protein.

6 The nucleic acid sequence encoding the permutein protein in plasmid pMON
7 37405 was created using the method illustrated in Figure 3 and described in Example 6.
8 Nucleic acid molecule “New N-termini fragment” was created and amplified from the
9 sequence encoding patatin in plasmid pMON26820 using oligonucleotide primers 48
10 (SEQ ID NO:243) and 58 (SEQ ID NO:249). Nucleic acid molecule “New C-termini
11 fragment” was created and amplified from the sequence encoding patatin in plasmid
12 pMON26820 using oligonucleotide primers 47 (SEQ ID NO:244) and 59 (SEQ ID
13 NO:249). The full-length nucleic acid molecule encoding the permutein protein was
14 created and amplified from annealed fragments “New N-termini fragment” and “New C-
15 termini fragment” using oligonucleotide primers 58 (SEQ ID NO:248) and 59 (SEQ ID
16 NO:249).

17 The resulting amplified nucleic acid molecule was digested with restriction
18 endonucleases XhoI and EcoRI, and purified using the QIAquick PCR purification kit
19 (Qiagen, Valencia, CA). Plasmid pMON 26869 (derivative of pPIC9, Invitrogen,
20 Carlsbad, CA) was digested with restriction endonucleases XhoI and EcoRI, and gel
21 purified, resulting in an approximately 2900 base pair vector fragment. The purified
22 restriction fragments were combined and ligated using T4 DNA ligase.

23 The ligation reaction mixture was used to transform *E. coli* strain DH5α cells
24 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
25 ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the
26 presence of the correct insert. The resulting plasmid was designated pMON 37405
27 (containing SEQ ID NO:250, encoding protein sequence SEQ ID NO:251).

Example 9: Construction of plasmid pMON 37406

Amino acids 183-184, adjacent to tyrosine 185, were chosen as a breakpoint for the construction of a permutein protein.

The nucleic acid sequence encoding the permutein protein in plasmid pMON 37406 was created using the method illustrated in Figure 3 and described in Example 6. Nucleic acid molecule "New N-termini fragment" was created and amplified from the sequence encoding patatin in plasmid pMON26820 using oligonucleotide primers 48 (SEQ ID NO:243) and 60 (SEQ ID NO:252). Nucleic acid molecule "New C-termini fragment" was created and amplified from the sequence encoding patatin in plasmid pMON26820 using oligonucleotide primers 47 (SEQ ID NO:244) and 61 (SEQ ID NO:253). The full-length nucleic acid molecule encoding the permutein protein was created and amplified from annealed fragments "New N-termini fragment" and "New C-termini fragment" using oligonucleotide primers 60 (SEQ ID NO:252) and 61 (SEQ ID NO:253).

The resulting amplified nucleic acid molecule was digested with restriction endonucleases XhoI and EcoRI, and purified using the QIAquick PCR purification kit (Qiagen, Valencia, CA). Plasmid pMON 26869 (derivative of pPIC9, Invitrogen, Carlsbad, CA) was digested with restriction endonucleases XhoI and EcoRI, and gel purified, resulting in an approximately 2900 base pair vector fragment. The purified restriction fragments were combined and ligated using T4 DNA ligase.

The ligation reaction mixture was used to transform *E. coli* strain DH5 α cells (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the presence of the correct insert. The resulting plasmid was designated pMON37406 (containing SEQ ID NO:254, encoding protein sequence SEQ ID NO:255).

Example 10: Construction of plasmid pMON 37407

Amino acids 268-269, adjacent to tyrosine 270, were chosen as a breakpoint for the construction of a permutein protein.

1 The nucleic acid sequence encoding the permutein protein in plasmid pMON
2 37407 was created using the method illustrated in Figure 3 and described in Example 6.
3 Nucleic acid molecule “New N-termini fragment” was created and amplified from the
4 sequence encoding patatin in plasmid pMON26820 using oligonucleotide primers 48
5 (SEQ ID NO:243) and 62 (SEQ ID NO:256). Nucleic acid molecule “New C-termini
6 fragment” was created and amplified from the sequence encoding patatin in plasmid
7 pMON26820 using oligonucleotide primers 47 (SEQ ID NO:244) and 63 (SEQ ID
8 NO:257). The full-length nucleic acid molecule encoding the permutein protein was
9 created and amplified from annealed fragments “New N-termini fragment” and “New C-
10 termini fragment” using oligonucleotide primers 62 (SEQ ID NO:256) and 63 (SEQ ID
11 NO:257).

12 The resulting amplified nucleic acid molecule was digested with restriction
13 endonucleases XhoI and EcoRI, and purified using the QIAquick PCR purification kit
14 (Qiagen, Valencia, CA). Plasmid pMON 26869 (derivative of pPIC9, Invitrogen,
15 Carlsbad, CA) was digested with restriction endonucleases XhoI and EcoRI, and gel
16 purified, resulting in an approximately 2900 base pair vector fragment. The purified
17 restriction fragments were combined and ligated using T4 DNA ligase.

18 The ligation reaction mixture was used to transform *E. coli* strain DH5α cells
19 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
20 ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the
21 presence of the correct insert. The resulting plasmid was designated pMON37407
22 (containing SEQ ID NO:258, encoding protein sequence SEQ ID NO:259).

23 Example 11: Construction of plasmid pMON 37408

24 Amino acids 321-322, near tyrosine 216, were chosen as a breakpoint for the
25 construction of a permutein protein.

26 The nucleic acid sequence encoding the permutein protein in plasmid pMON
27 37408 was created using the method illustrated in Figure 3 and described in Example 6.
28 Nucleic acid molecule “New N-termini fragment” was created and amplified from the
29 sequence encoding patatin in plasmid pMON26820 using oligonucleotide primers 48
30 (SEQ ID NO:243) and 64 (SEQ ID NO:260). Nucleic acid molecule “New C-termini

1 fragment” was created and amplified from the sequence encoding patatin in plasmid
2 pMON26820 using oligonucleotide primers 47 (SEQ ID NO:244) and 65 (SEQ ID
3 NO:261). The full-length nucleic acid molecule encoding the permutein protein was
4 created and amplified from annealed fragments “New N-termini fragment” and “New C-
5 termini fragment” using oligonucleotide primers 64 (SEQ ID NO:260) and 65 (SEQ ID
6 NO:261).

7 The resulting amplified nucleic acid molecule was digested with restriction
8 endonucleases XhoI and EcoRI, and purified using the QIAquick PCR purification kit
9 (Qiagen, Valencia, CA). Plasmid pMON 26869 (derivative of pPIC9, Invitrogen,
10 Carlsbad, CA) was digested with restriction endonucleases XhoI and EcoRI, and gel
11 purified, resulting in an approximately 2900 base pair vector fragment. The purified
12 restriction fragments were combined and ligated using T4 DNA ligase.

13 The ligation reaction mixture was used to transform *E. coli* strain DH5α cells
14 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
15 ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the
16 presence of the correct insert. The resulting plasmid was designated pMON37408
17 (containing SEQ ID NO:262, encoding protein sequence SEQ ID NO:263).

18 Example 12: Production of permutein proteins in *Pichia pastoris*

19 Plasmids pMON37402, pMON37405, pMON37406, pMON37407, and
20 pMON37408 were individually used to electroporate KM71 cells from *Pichia pastoris*
21 according to the procedure supplied by the manufacturer (Invitrogen, Carlsbad, CA). The
22 resulting transformed cells were used to produce protein in *Pichia pastoris* following the
23 procedure supplied by the manufacturer (Invitrogen, Carlsbad, CA).

24 The concentration of patatin in the culture was determined using a patatin ELISA
25 assay and the enzyme activity was measured using the method of Hofgen and Willmitzer
26 (*Plant Science*, 66: 221-230, 1990). The variants containing multiple mutations were
27 further purified using Mono Q and hydrophobic interaction chromatography (HIC). Each
28 culture was purified by first sizing on YM10 membranes (Amicon, MA) to a [>10 kDa]
29 fraction, followed by chromatography on the Mono Q HR 10/10 column (Pharmacia, NJ).
30 For chromatography on the Mono Q column, the samples were loaded on the column in

1 25 mM Tris pH 7.5 and eluted with a gradient of 1.0 M KCl in 25 mM Tris pH 7.5.
 2 Fractions containing patatin protein were determined using SDS-PAGE. For
 3 chromatography on the HIC column, the appropriate fractions were pooled and dialyzed
 4 into 1 M ammonium sulfate in 25 mM Tris pH 7.5. The dialyzed sample was then loaded
 5 on 16/10 phenyl Sepharose column (Pharmacia, NJ) and eluted with a gradient of 25 mM
 6 Tris pH7.5.

7 The protein concentration was determined using the Bradford method, using BSA
 8 as a standard. SDS-PAGE analysis showed that these proteins were essentially pure. The
 9 esterase activity of the variants are shown in Table 7.

10 Table 7: Activity of permuteins

| pMON | Breakpoint | Activity ($\Delta\text{OD min}^{-1}\mu\text{g}^{-1}$) |
|---------------|------------|---|
| Native enzyme | | 83.21 |
| pMON37402 | 246/247 | 66.7 |
| pMON37405 | 201/202 | No expression |
| pMON37406 | 183/184 | No expression |
| pMON37407 | 268/269 | 12.1 |
| pMON37408 | 321/322 | No expression |

11
 12 The activity was determined using *p*-nitrophenyl caprate substrate as described by
 13 Hofgen and Willmitzer (*Plant Science*, 66: 221-230, 1990).

14 Example 13: Insect bioefficacy assays

15 Assays for activity against larvae of SCRW are carried out by overlaying the test
 16 sample on an agar diet similar to that described by Marrone (*J. Econ. Entom.* 78: 290-
 17 293, 1985). Test samples were prepared in 25 mM Tris, pH 7.5 buffer. Neonate larvae
 18 are allowed to feed on the treated diet at 26°C, and mortality and growth stunting were
 19 evaluated after 5 or 6 days. The results of this assay are shown in Table 8.

20 Table 8: Insect bioefficacy assay

| Protein (200 ppm) | Mean Survival Weight | % Weight Reduction |
|-----------------------|----------------------|--------------------|
| Tris buffer (control) | 1.26 \pm 0.3 | - |
| Wild Type | 0.21 \pm 0.02 | 83 |

| | | |
|-----------|-------------|----|
| pMON37402 | 0.21 ± 0.03 | 83 |
| pMON37407 | 0.32 ± 0.04 | 75 |

These data demonstrate that the growth of the SCRW larvae is similarly reduced upon ingestion of the proteins encoded by pMON37402 and pMON37407 as compared to the wild type patatin protein.

Example 14: Permutein sequences improved for monocot expression

Modification of coding sequences has been demonstrated above to improve expression of insecticidal proteins. A modified coding sequence was thus designed to improve expression in plants, especially corn (SEQ ID NO:264).

Example 15: Construction of pMON40701 for monocot expression

Plasmid pMON19767 was digested with restriction endonucleases NcoI and EcoRI and the 1100 bp gene fragment was purified using the QIAquick PCR purification kit (Qiagen, Valencia, CA). Plasmid pMON33719 was digested with restriction endonucleases NcoI and EcoRI, and gel purified, resulting in an approximately 3900 base pair vector fragment. The two purified restriction fragments were combined and ligated using T4 DNA ligase.

The ligation reaction mixture was used to transform *E. coli* strain DH5α cells (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the presence of the correct insert. The resulting plasmid was designated pMON40700. Plasmid pMON40700 was digested with restriction endonuclease NotI and the resulting 2200 bp DNA fragment was purified using the QIAquick PCR purification kit (Qiagen, Valencia, CA). Plasmid pMON30460 was digested with restriction endonuclease NotI, and gel purified, resulting in an approximately 4200 base pair vector fragment. The two purified restriction fragments were combined and ligated using T4 DNA ligase.

The ligation reaction mixture was used to transform *E. coli* strain DH5α cells (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on

1 kanamycin-containing plates. The resulting plasmid was designated pMON40701
2 (containing SEQ ID NO:264, encoding protein sequence SEQ ID NO:265).

3 Example 16: Construction of pMON40703 for monocot expression

4 The nucleic acid sequence encoding the permutein protein in plasmid
5 pMON40703 was created using the method illustrated in Figure 3 and described in
6 Example 6. Nucleic acid molecule “New N-termini fragment” was created and amplified
7 from the sequence encoding patatin in plasmid pMON19767 using oligonucleotide
8 primers Syn1 (SEQ ID NO:266) and Syn2 (SEQ ID NO:267). Nucleic acid molecule
9 “New C-termini fragment” was created and amplified from the sequence encoding patatin
10 in plasmid pMON19767 using oligonucleotide primers Syn3 (SEQ ID NO:268) and Syn4
11 (SEQ ID NO:269). The full-length nucleic acid molecule encoding the permutein protein
12 was created and amplified from annealed fragments “New N-termini fragment” and
13 “New C-termini fragment” using oligonucleotide primers Syn1 (SEQ ID NO:266) and
14 Syn4 (SEQ ID NO:269).

15 The resulting amplified nucleic acid molecule was digested with restriction
16 endonucleases NcoI and EcoRI, and purified using the QIAquick PCR purification kit
17 (Qiagen, Valencia, CA). Plasmid pMON33719 was digested with restriction
18 endonucleases NcoI and EcoRI, and gel purified, resulting in an approximately 3900 base
19 pair vector fragment. The purified restriction fragments were combined and ligated using
20 T4 DNA ligase.

21 The ligation reaction mixture was used to transform *E. coli* strain DH5 α cells
22 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
23 ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the
24 presence of the correct insert. The resulting plasmid was designated pMON40702.
25 Plasmid pMON40702 was digested with NotI, and the resulting 2200 bp DNA fragment
26 was purified using the QIAquick PCR purification kit (Qiagen, Valencia, CA). Plasmid
27 pMON30460 was digested with restriction endonuclease NotI, and gel purified, resulting
28 in an approximately 4200 base pair vector fragment. The purified restriction fragments
29 were combined and ligated using T4 DNA ligase.

1 The ligation reaction mixture was used to transform *E. coli* strain DH5 α cells
2 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
3 kanamycin-containing plates. The resulting plasmid was designated pMON40703
4 (containing SEQ ID NO:270, encoding protein sequence SEQ ID NO:271). Plasmid
5 pMON40703 encodes a permutein protein with a “breakpoint” at positions 246/247 of the
6 wild type patatin protein sequence (SEQ ID NO:2). The first 23 amino acids of SEQ ID
7 NO:2 are a signal peptide sequence which is cleaved in the mature protein.

8 Example 17: Construction of pMON40705 for monocot expression

9 The nucleic acid sequence encoding the permutein protein in plasmid
10 pMON40705 was created using the method illustrated in Figure 3 and described in
11 Example 6. Nucleic acid molecule “New N-termini fragment” was created and amplified
12 from the sequence encoding patatin in plasmid pMON19767 using oligonucleotide
13 primers Syn10 (SEQ ID NO:272) and Syn2 (SEQ ID NO:267). Nucleic acid molecule
14 “New C-termini fragment” was created and amplified from the sequence encoding patatin
15 in plasmid pMON19767 using oligonucleotide primers Syn3 (SEQ ID NO:268) and
16 Syn11 (SEQ ID NO:273). The full-length nucleic acid molecule encoding the permutein
17 protein was created and amplified from annealed fragments “New N-termini fragment”
18 and “New C-termini fragment” using oligonucleotide primers Syn10 (SEQ ID NO:272)
19 and Syn11 (SEQ ID NO:273).

20 The resulting amplified nucleic acid molecule was digested with restriction
21 endonucleases NcoI and EcoRI, and purified using the QIAquick PCR purification kit
22 (Qiagen, Valencia, CA). Plasmid pMON33719 was digested with restriction
23 endonucleases NcoI and EcoRI, and gel purified, resulting in an approximately 3900 base
24 pair vector fragment. The purified restriction fragments were combined and ligated using
25 T4 DNA ligase.

26 The ligation reaction mixture was used to transform *E. coli* strain DH5 α cells
27 (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on
28 ampicillin-containing plates. Plasmid DNA was isolated and sequenced to confirm the
29 presence of the correct insert. The resulting plasmid was designated pMON40704.
30 Plasmid pMON40704 was digested with restriction endonuclease NotI, and the resulting

2200 bp DNA fragment was purified using the QIAquick PCR purification kit (Qiagen, Valencia, CA). Plasmid pMON30460 was digested with restriction endonuclease NotI, and gel purified, resulting in an approximately 4200 base pair vector fragment. The purified restriction fragments were combined and ligated using T4 DNA ligase.

The ligation reaction mixture was used to transform *E. coli* strain DH5 α cells (Life Technologies, Gaithersburg, MD). Transformant bacteria were selected on plates containing kanamycin. The resulting plasmid was designated pMON40705 (containing SEQ ID NO:274, encoding protein sequence SEQ ID NO:275). Plasmid pMON40705 encodes a permutein protein with a “breakpoint” at positions 268/269 of the wild type patatin protein sequence (SEQ ID NO:2). The first 23 amino acids of SEQ ID NO:2 are a signal peptide sequence which is cleaved in the mature protein.

Example 18: Transient expression of protein in corn leaf protoplasts

Plasmids pMON40701, pMON40703, and pMON40705 (all containing the native signal sequence for vacuolar targeting) were separately electroporated into corn leaf protoplasts as described by Sheen (*Plant Cell* 3: 225-245, 1991). Protein was extracted with glass beads and the supernatant was assayed for protein expression using ELISA for patatin and NPTII. Expression of protein by the transformed corn protoplasts was confirmed by Western blot analysis. Expression results are shown in Table 9.

Table 9: ELISA data

| Sample | Patatin ELISA ($\mu\text{g/mL}$) | NPTII ELISA ($\mu\text{g/mL}$) | Normalized Expression (Patatin ELISA/NPTII ELISA) |
|-----------|---------------------------------------|-------------------------------------|--|
| pMON40701 | 1.1 | 0.6 | 1.8 |
| pMON40703 | 2.1 | 0.3 | 7.0 |
| pMON40705 | 1.3 | 0.6 | 2.2 |

The results indicate that the permutein encoded by plasmid pMON40703 surprisingly shows approximately 4-fold higher expression compared to the wild type enzyme.

Example 19: Deglycosylation of protein sequences

This example provides evidence that glycosylation of can contribute to the allergenicity of a protein. Accordingly, rational substitution of amino acid residues likely to be the targets of glycosylation within a subject allergen protein may reduce or eliminate the allergenic properties of the protein without adversely affecting the enzymatic, insecticidal, antifungal or other functional properties of the protein.

Glycosylation commonly occurs as either N-linked or O-linked forms. N-linked glycosylation usually occurs at the motif Asn-Xaa-Ser/Thr, where Xaa is any amino acid except Pro (Kasturi, L. et al., *Biochem J.* 323: 415-519, 1997; Melquist, J.L. et al., *Biochemistry* 37: 6833-6837, 1998). O-linked glycosylation occurs between the hydroxyl group of serine or threonine and an amino sugar.

Site directed mutagenesis of selected asparagine, serine, or threonine may be used to reduce or eliminate the glycosylation of patatin proteins. A search of SEQ ID NO:2 for the Asn-Xaa-Ser/Thr motif reveals one occurrence at amino acid positions 202-204. Mutagenization of the nucleic acid sequence encoding this region results in a reduced allergenicity of the encoded protein.

In order to test this approach to reducing allergenicity of patatin proteins, two sets of experiments were performed: a) production of patatin proteins in *Escherichia coli*, which do not glycosylate proteins; and b) production of patatin proteins with an N202Q site directed mutation.

Antibodies obtained from patients HS-07 and G15-MON (not potato allergic) did not show specific binding to wild type patatin, patatin produced in *E. coli*, or the N202Q variant. Antibodies obtained from patient HS-01 (potato allergic) bound to wild type patatin, but not to patatin produced in *E. coli* or the N202Q variant. Antibodies obtained from patient HS-02 (potato allergic) bound strongly to wild type patatin, but extremely weakly to patatin produced in *E. coli*, and binding to the N202Q variant resembled vector controls. Antibodies obtained from patient HS-03 (potato allergic) bound to wild type patatin, but not to patatin produced in *E. coli* or the N202Q variant. Antibodies obtained from patient HS-05 (potato allergic) bound to wild type patatin, but very weakly to patatin produced in *E. coli* and the N202Q variant. Antibodies obtained from patient HS-06 (potato allergic) strongly bound wild type patatin, the N202Q variant, and to patatin

1 produced in *E. coli*. These results strongly suggest that glycosylation is at least partially
2 responsible for the antigenic properties of patatin proteins, and that site directed
3 mutagenesis may be used to reduce or eliminate specific antibody binding. Mutagenesis
4 at position 202 of SEQ ID NO:2 may be useful for reducing or eliminating specific
5 antibody binding.

6 The deglycosylation approach was also tested using a patatin homolog, Pat17. As
7 demonstrated above, patatin epitopes exhibiting IgE binding were identified, and each
8 contained a Tyr residue. Substitution of these Tyr residues within each epitope led to loss
9 of IgE binding. Site-directed mutagenesis was used to produce variants with individual
10 and multiple Tyr substitutions in the protein, which was expressed in *Pichia pastoris* and
11 assessed for enzyme activity. All the variants were found to have enzymatic activity no
12 less than the wild type protein. A single variant with all 5 tyrosine residues substituted
13 with phenylalanine was found to have insecticidal activity no less than the unsubstituted
14 protein and was expressed in *E.coli* to produce the non-glycosylated version. The *E.coli*
15 5-"Tyr to Phe" variant was assessed for IgE binding. An isozyme of patatin, designated
16 Pat17, was also expressed in corn to produce a plant glycoprotein and in *E.coli* to
17 produce a nonglycosylated protein. Sera of seven patients (five exhibiting potato allergy
18 and one exhibiting other allergies but no allergy to potatoes) were used to assay
19 Pat17 or Pat17 variant binding by immunoblot assay. Four of the five sera from patients
20 exhibiting potato allergy showed either very weak or no binding to wild type patatin
21 expressed in *E.coli* but did bind to the 5-Tyr variant. Serum from one patient exhibiting
22 potato allergy showed strong binding to recombinant wild type patatin protein expressed
23 in *E.coli* but weak binding to the 5-Tyr variant. Sera from all five patients exhibiting
24 potato allergy bound strongly to patatin expressed in corn and native patatin present in
25 potatoes. Serum from a control patient allergic to eggs, milk, peanuts and seafood, but
26 exhibiting no allergy to potatoes showed no binding to patatin expressed in *E.coli* but did
27 bind to patatin expressed in corn. Immunoblot results suggested that the sugar moiety in
28 patatin is a non-specific IgE binding epitope and the polypeptide portion of patatin also
29 contains immunogenic IgE epitopes.

1 Patients who suffer from potato allergy were identified at Johns Hopkins Clinic
2 (Baltimore, MD) and were evaluated for potato allergy using clinical criteria outlined in
3 Table 2.

4 Serum was obtained from patients with convincing clinical history of potato
5 allergy. The convincing history was defined as being one or more of the following: a)
6 positive potato allergic reaction as evaluated by double-blind placebo-control food
7 challenge b) anaphylaxis and/or hospitalization due to the consumption of potatoes or c)
8 dramatic skin test results.

9 Peptide Synthesis

10 Peptides were synthesized on cellulose membranes using the SPOTS system
11 (Genosys Biotechnologies, TX). Membranes were stored at -20°C until use.

12 Site directed Mutagenesis

13 Site specific mutations were introduced into patatin by first incorporating part of
14 the a-factor signal sequence (*Pichia* expression manual, Invitrogen, Carlsbad, CA) to the
15 patatin gene using PCR. Primers used for the PCR were
16 GGAGCTCGAGAAAAGAGAGGCTGAAGCTCAGTTGGGAGAAATGGTGACTGT
17 TCT (*Xho*I site in italics) and GGTCTAGAG *GAATT*CTCATTAATAAGAAG (*Eco*RI
18 site in italics). The primers contained restriction sites to facilitate cloning into *Pichia*
19 *pastoris* yeast secretion vector pPIC9 (GenBank accession number Z46233; Invitrogen,
20 Carlsbad, CA). Typical PCR conditions are 25 cycles 94°C denaturation for 1 minute,
21 45°C annealing for one minute and 72°C extension for 2 minutes; plus one cycle 72°C
22 extension for 10 minutes. A 50 mL reaction contained 30 pmol of each primer and 1 mg
23 of template DNA; and 1 X PCR buffer with MgCl₂, 200 mM dGTP, 200 mM dATP, 200
24 mM dTTP, 200 mM dCTP, 2.5 units of *Pwo* DNA polymerase. PCR reactions are
25 performed in RoboCycler Gradient 96 Temperature Cycler (Stratagene, La Jolla, CA).

26 The amplified patatin gene was digested with restriction enzymes *Xho*I and *Eco*RI
27 and cloned into the pBluescript vector (Stratagene, La Jolla, CA), digested with the same
28 two restriction enzymes. The template plasmid DNA used for the PCR was
29 pMON26820. The resulting plasmid (pMON 26869) was used for oligonucleotide-
30 directed mutagenesis using the Bio-Rad mutagenesis kit based on the method of Kunkel

1 et al., *Proc Natl Acad Sci USA* 82, 477-92 (1985). Briefly, single-stranded pMON26869
2 was used as template for mutagenesis and was prepared by superinfection of plasmid
3 containing cells with M13K07 (Gorman et al., *DNA and Protein Engineering techniques*
4 2, 3-10 (1990)). DNA purified from transformed DH5a *E. coli* colonies was used for
5 sequence determination. Sequencing was performed using the ABI PRISM sequencing
6 kit (Perkin Elmer Biosystems, Foster City, CA).

7 Protein Expression in *Pichia pastoris*

8 Plasmids containing the mutations in the patatin gene were digested with restriction
9 enzymes *XhoI* and *EcoRI*. The patatin nucleic acid fragment was then ligated into the
10 pPIC9 vector (Invitrogen, Carlsbad, CA), digested with the same two restriction enzymes
11 to afford plasmid pMON37401. *Pichia pastoris* KM71 cells were electroporated with
12 pMON37401 containing the appropriate mutation. The resulting transformed cells were
13 used to produce protein in *Pichia pastoris* using the procedure supplied by the
14 manufacturer (Invitrogen, Carlsbad, CA). The proteins were purified in the same way as
15 the proteins expressed in *E. coli* (see below).

16 Western Blotting of Proteins

17 Protein samples were electrophoresed by SDS-PAGE and electroblotted onto PVDF
18 membrane (Millipore, Bedford MA). Protein blots were processed by standard Western
19 blotting (immunoblotting) techniques and were incubated in potato allergic serum diluted
20 1:5 in PBS buffer for 1 hour. After washing the blots 3 times with PBS, the blots were
21 incubated in biotinylated anti-IgE (Johns Hopkins Hospital, Baltimore MD) for 1 hour,
22 followed by a 30 minute incubation in HRP-linked avidin (Promega, New York, NY).
23 IgE-reactive protein bands were visualized by using the ECL system (Amersham
24 Pharmacia Biotech, NJ). As a control, one blot was incubated in anti-IgE only. His-
25 tagged glyphosate oxidase and potato extracts was prepared and provided for this study
26 by Regulatory Sciences, Monsanto Company. The peptides were evaluated using the
27 same incubation procedures as described above.

28 Expression and purification of patatin in corn

29 An isozyme of patatin, Pat17, was generated for expression in corn using a modified
30 plant optimized gene sequence as described by Brown *et al* (US Patent 5,689,052). All

1 the constructs contained the native 23 amino acid signal peptide for vacuolar targeting.
2 Corn was transformed by microprojectile bombardment (Morrish et al., in *Transgenic*
3 *plants. Fundamentals and Applications* (ed. Hiatt, A.) 133-171 (Marcel Dekker, New
4 York, 1993); Songstad et al., *In Vitro Cell Dev Biol - Plant* 32, 179-183 (1996)).
5 Protein from the transformed corn plants was purified by first grinding the leaves in
6 liquid nitrogen and extracting the protein using 25 mM Tris/HCl. The plant extract was
7 further dialyzed against 25 mM Tris/HCl pH 7.5. The plant extract was then loaded onto
8 Mono Q HR 10/10 anion-exchange column (Amersham Pharmacia, NJ) equilibrated with
9 25 mM Tris/HCl pH 7.5 (buffer A). The protein was eluted with 25 mM Tris/HCl pH
10 7.5, 1 M KCl (buffer B) using a linear gradient of 0-100% buffer B using an HPLC
11 system (Shimadzu). Fractions containing protein were assayed for esterase activity and
12 dialyzed against 25 mM Tris/HCl pH 7.5, 1 M Ammonium Sulfate (buffer C). The
13 protein was purified to homogeneity by loading onto a phenyl-Sepharose 16/10 column
14 (Amersham Pharmacia, NJ) equilibrated with buffer C. Esterase active fractions were
15 pooled and dialyzed against 25 mM Tris/HCl pH 7.5.

16 Expression and purification of patatin in *E.coli*

17 Pat17 was expressed in *E.coli* using the pET expression system (Novagen, WI). The
18 coding region of the mature Pat17 gene (without its signal peptide) was amplified by
19 PCR using the primers 5'-GGGCCATGGCGCAGTTGGGAGAAATGGTG-3' (*NcoI* site
20 in italics) and 5'-AACAAAGCTTCTTATTGAGGTGCGGCCGCTTGCATGC-3' (*NotI*
21 site in italics) using standard PCR reaction conditions as described in the Gene Amp kit
22 (Perkin-Elmer Cetus, CT) and an annealing temperature of 40°C. The template was
23 plasmid pMON26820. The resulting DNA was digested with *NcoI* and *NotI* and cloned
24 into a modified pET24d plasmid, designed to add an N-terminal hexa-histidine tag to the
25 protein. The correct sequence of the PCR product was verified by sequencing, and the
26 plasmid was transformed into *E.coli* BL21 (DE3), and transformants selected on LB
27 containing 25 mg/mL kanamycin. The expression strain was grown in LB containing 25
28 mg/mL kanamycin and induced for 8 hrs at 28°C with 1 mM IPTG. Cells were harvested
29 and washed in 50 mM Tris/HCl pH 8.5, 150 mM NaCl, and lysed by French Press at
30 20,000 psi. His-tagged protein was recovered in the soluble fraction of lysed cells and
31 subsequently purified using Ni-NTA resin as described in the QIAexpressionist manual

(Qiagen CA). The partially purified protein was then dialyzed against 25 mM Tris/HCl pH 7.5 (buffer A) and loaded onto Mono Q HR 10/10 anion-exchange column (Amersham Pharmacia, NJ) equilibrated with buffer A. The protein was eluted with 25 mM Tris/HCl pH 7.5, 1 M KCl (buffer B) using a linear gradient of 0-100% buffer B run over 30 min at a flow rate of 4 mL/min using an HPLC system (Shimadzu). Fractions containing protein were assayed for esterase activity. Esterase active fractions were pooled, concentrated and dialyzed against 25 mM Tris/HCl pH 7.5 and stored at 4°C.

Enzyme Activity Assays

Enzyme activity was measured as described previously using *p*-nitrophenyl caprate (Sigma, MO) as a substrate, dissolved in dimethylsulfoxide (5 mM stock solution) and diluted in 4% Triton X-100, 1% SDS to a final concentration of 1 mM. For the assay, 20 mL of protein solution was added to a mixture of 25 mL of the 1 mM substrate solution and 80 mL of 50 mM Tris pH 8.5. The enzyme activity was monitored at 405 nm in 6 sec interval for a period of 10 min. Esterase activity was expressed as DOD min⁻¹mg⁻¹ protein.

Insect Bioassay

The protein was also assayed for activity against larvae of *Diabrotica virgifera* (Western corn rootworm) by overlaying the test sample on an agar diet similar to that described previously (Marrone et al., *J. Econ. Entom.* 78, 290-3 (1985)). Proteins to be tested were diluted in 25 mM Tris/HCl pH 7.5 and overlayed on the diet surface. Neonate larvae were allowed to feed on the diet and mortality and growth stunting were evaluated after 6 days.

IgE Binding Epitopes on Patatin

A panel of eighty-nine overlapping peptides representing the amino acid sequence of patatin were synthesized to determine the regions responsible for IgE binding. Each peptide was 10 amino acids long and consisted of 6 amino acid overlap between the consecutive peptides. The peptides were evaluated for IgE binding with five different potato allergic patient sera. Patatin has 3 major epitopes. These major IgE binding regions represent amino acids 184-193, 188-197, 269-278 and 360-369. Other minor IgE binding regions represent amino acids 104-113, 138-147 and 316-325. The amino acids

1 essential for IgE binding in each major and minor epitopes were determined by
2 synthesizing peptides with single amino acid changes at each position by individually
3 substituting an alanine residue at each non-alanine position in the epitopes. The resulting
4 alanine substituted peptides were evaluated for IgE binding. Result effective
5 substitutions were identified by a reduction in IgE binding with respect to the non-
6 substituted peptide sequence. It was very interesting to note that all the epitopes
7 contained a Tyr residue and substitution of this Tyr for Ala or Phe eliminated IgE
8 binding.

9 Enzyme and Bioactivity

10 The Tyr residues identified to be critical for IgE binding in each of the epitopes were
11 substituted with Phe either individually or in concert using site-directed mutagenesis. All
12 the variants were expressed in *Pichia pastoris* and assessed for enzyme activity and
13 insecticidal activity. The variants included Y106F, Y129F, Y185F, Y193F, Y270F,
14 Y316F, Y362F, Y185F/Y193F, Y185F/Y193F/Y270F/Y316F/Y362F (5-Tyr) and
15 Y106F/Y129F/Y185F/Y193F/Y270F/Y316F/ Y362F (7-Tyr). All the variants
16 maintained enzyme activity. The 5-Tyr and 7-Tyr variants were then assessed for
17 insecticidal activity by overlaying protein (200 ppm final concentration). The proteins
18 caused significant stunting of the larval growth as measured by the weight of the larvae
19 after 6 days with the 5-Tyr variant showing higher insecticidal activity compared to the 7-
20 Tyr and wild type proteins. The 7-Tyr variant was unstable upon long term storage at
21 4°C and thus was not pursued further.

22 Immunoblotting

23 In order to test if the glycan moiety on patatin was important for binding of IgE, Pat17
24 was expressed in *E.coli* to produce a nonglycosylated protein and in corn to produce a
25 plant glycosylated protein. The 5-Tyr variant was also expressed in *E.coli* to assess the
26 individual contribution of the linear epitopes without the glycan moiety on the protein.
27 The proteins were tested for binding to IgE using sera from five patients with allergy to
28 potatoes and sera from one patient with allergies to many things but no allergy to
29 potatoes. Proteins from both corn and *E.coli* were purified to homogeneity. These
30 proteins were transferred to PVDF membrane (Millipore, MA) and subsequently probed

1 with sera from patients with and without allergy to potatoes. A His-tagged glyphosate
2 oxidase control was included in all the studies to verify that the His-tag did not affect the
3 binding of IgE. Serum obtained from patient HS-07 (no allergy to potatoes) did not bind
4 Pat17 expressed in *E.coli* but showed good binding to Pat17 from corn and also a protein
5 at the same molecular weight in potato extract. It is interesting to note that this sera also
6 showed strong binding to another protein (> 46kDa) in the potato. Sera from patients
7 HS-01, HS-02, HS-03, HS-05 (allergy to potatoes) shows strong binding to Pat17
8 expressed in corn, but very weak to no binding to Pat17 produced in *E.coli*. Also, the
9 sera from patients HS-01, HS-2, HS-03 and HS-05 bound to a protein of similar
10 molecular weight in the potato extract. Sera from patients HS-01, HS-02 and HS-03 also
11 showed binding to another protein in potato extract of a lower molecular weight (<
12 30kDa). Serum obtained from patient HS-06 (allergic to potatoes) showed very strong
13 binding to wild type patatin expressed in both corn and *E.coli* but weaker binding to the
14 5-Tyr variant expressed in *E.coli*. Sera from HS-06 also showed very strong binding to a
15 protein in potato extract with similar molecular weight as patatin. The sera from all the
16 patients showed no binding to His-tagged glyphosate oxidase indicating that the His-tag
17 does not bind IgE. These results strongly suggest that the glycan moiety on Pat17 is
18 responsible for IgE binding in some potato allergic patients and linear epitopes also
19 contribute to the antigenicity of patatin.

20 Example 20: Alternative nucleic acid and protein sequences

21 For future variations of the patatin protein, sequences showing high similarity to
22 the sequences disclosed herein could be used in producing deallergized patatin proteins
23 and permuteins. For example, a BLAST search (Altschul, S.F. et al., *J. Mol. Biol.* 215:
24 403-410, 1990) can be performed to identify additional patatin sequences. Sources other
25 than those disclosed herein can be used to obtain a patatin nucleic acid sequence, and the
26 encoded patatin protein. Furthermore, subunit sequences from different organisms can be
27 combined to create a novel patatin sequence incorporating structural, regulatory, and
28 enzymatic properties from different sources.

Example 21: Nucleic acid mutation and hybridization

Variations in the nucleic acid sequence encoding a patatin protein may lead to mutant patatin protein sequences that display equivalent or superior enzymatic characteristics when compared to the sequences disclosed herein. This invention accordingly encompasses nucleic acid sequences which are similar to the sequences disclosed herein, protein sequences which are similar to the sequences disclosed herein, and the nucleic acid sequences that encode them. Mutations can include deletions, insertions, truncations, substitutions, fusions, shuffling of subunit sequences, and the like.

Mutations to a nucleic acid sequence can be introduced in either a specific or random manner, both of which are well known to those of skill in the art of molecular biology. A myriad of site-directed mutagenesis techniques exist, typically using oligonucleotides to introduce mutations at specific locations in a nucleic acid sequence. Examples include single strand rescue (Kunkel, T. *Proc. Natl. Acad. Sci. U.S.A.*, 82: 488-492, 1985), unique site elimination (Deng and Nickloff, *Anal. Biochem.* 200: 81, 1992), nick protection (Vandeyar, et al. *Gene* 65: 129-133, 1988), and PCR (Costa, et al. *Methods Mol. Biol.* 57: 31-44, 1996). Random or non-specific mutations can be generated by chemical agents (for a general review, see Singer and Kusmierek, *Ann. Rev. Biochem.* 52: 655-693, 1982) such as nitrosoguanidine (Cerdeira-Olmedo et al., *J. Mol. Biol.* 33: 705-719, 1968; Guerola, et al. *Nature New Biol.* 230: 122-125, 1971) and 2-aminopurine (Rogan and Bessman, *J. Bacteriol.* 103: 622-633, 1970), or by biological methods such as passage through mutator strains (Greener et al. *Mol. Biotechnol.* 7: 189-195, 1997).

Nucleic acid hybridization is a technique well known to those of skill in the art of DNA manipulation. The hybridization properties of a given pair of nucleic acids is an indication of their similarity or identity. Mutated nucleic acid sequences can be selected for their similarity to the disclosed patatin nucleic acid sequences on the basis of their hybridization to the disclosed sequences. Low stringency conditions can be used to select sequences with multiple mutations. One may wish to employ conditions such as about 0.15 M to about 0.9 M sodium chloride, at temperatures ranging from about 20°C to about 55°C. High stringency conditions can be used to select for nucleic acid sequences with higher degrees of identity to the disclosed sequences. Conditions employed may

include about 0.02 M to about 0.15 M sodium chloride, about 0.5% to about 5% casein, about 0.02% SDS and/or about 0.1% N-laurylsarcosine, about 0.001 M to about 0.03 M sodium citrate, at temperatures between about 50°C and about 70°C. More preferably, high stringency conditions are 0.02 M sodium chloride, 0.5% casein, 0.02% SDS, 0.001 M sodium citrate, at a temperature of 50°C.

Example 22: Determination of homologous and degenerate nucleic acid sequences

Modification and changes can be made in the sequence of the proteins of the present invention and the nucleic acid segments which encode them and still obtain a functional molecule that encodes a protein with desirable properties. The following is a discussion based upon changing the amino acid sequence of a protein to create an equivalent, or possibly an improved, second-generation molecule. The amino acid changes can be achieved by changing the codons of the nucleic acid sequence, according to the codons given in Table 10.

Table 10: Codon degeneracies of amino acids

| Amino acid | One letter | Three letter | Codons |
|---------------|------------|--------------|-------------------------|
| Alanine | A | Ala | GCA GCC GCG GCT |
| Cysteine | C | Cys | TGC TGT |
| Aspartic acid | D | Asp | GAC GAT |
| Glutamic acid | E | Glu | GAA GAG |
| Phenylalanine | F | Phe | TTC TTT |
| Glycine | G | Gly | GGA GGC GGG GGT |
| Histidine | H | His | CAC CAT |
| Isoleucine | I | Ile | ATA ATC ATT |
| Lysine | K | Lys | AAA AAG |
| Leucine | L | Leu | TTA TTG CTA CTC CTG CTT |
| Methionine | M | Met | ATG |
| Asparagine | N | Asn | AAC AAT |
| Proline | P | Pro | CCA CCC CCG CCT |
| Glutamine | Q | Gln | CAA CAG |
| Arginine | R | Arg | AGA AGG CGA CGC CGG CGT |
| Serine | S | Ser | AGC AGT TCA TCC TCG TCT |
| Threonine | T | Thr | ACA ACC ACG ACT |
| Valine | V | Val | GTA GTC GTG GTT |
| Tryptophan | W | Trp | TGG |
| Tyrosine | Y | Tyr | TAC TAT |

1 Certain amino acids can be substituted for other amino acids in a protein sequence
2 without appreciable loss of enzymatic activity. It is thus contemplated that various
3 changes can be made in the peptide sequences of the disclosed protein sequences, or their
4 corresponding nucleic acid sequences without appreciable loss of the biological activity.

5 In making such changes, the hydropathic index of amino acids can be considered.
6 The importance of the hydropathic amino acid index in conferring interactive biological
7 function on a protein is generally understood in the art (Kyte and Doolittle, *J. Mol. Biol.*,
8 157: 105-132, 1982). It is accepted that the relative hydropathic character of the amino
9 acid contributes to the secondary structure of the resultant protein, which in turn defines
10 the interaction of the protein with other molecules, for example, enzymes, substrates,
11 receptors, DNA, antibodies, antigens, and the like.

12 Each amino acid has been assigned a hydropathic index on the basis of their
13 hydrophobicity and charge characteristics. These are: isoleucine (+4.5); valine (+4.2);
14 leucine (+3.8); phenylalanine (+2.8); cysteine/cystine (+2.5); methionine (+1.9); alanine
15 (+1.8); glycine (-0.4); threonine (-0.7); serine (-0.8); tryptophan (-0.9); tyrosine (-1.3);
16 proline (-1.6); histidine (-3.2); glutamate/glutamine/aspartate/asparagine (-3.5); lysine (-
17 3.9); and arginine (-4.5).

18 It is known in the art that certain amino acids can be substituted by other amino
19 acids having a similar hydropathic index or score and still result in a protein with similar
20 biological activity, i.e., still obtain a biologically functional protein. In making such
21 changes, the substitution of amino acids whose hydropathic indices are within ± 2 is
22 preferred, those within ± 1 are more preferred, and those within ± 0.5 are most preferred.

23 It is also understood in the art that the substitution of like amino acids can be
24 made effectively on the basis of hydrophilicity. U.S. Patent No. 4,554,101 (Hopp, T.P.,
25 issued November 19, 1985) states that the greatest local average hydrophilicity of a
26 protein, as governed by the hydrophilicity of its adjacent amino acids, correlates with a
27 biological property of the protein. The following hydrophilicity values have been
28 assigned to amino acids: arginine/lysine (+3.0); aspartate/glutamate (+3.0 ± 1); serine
29 (+0.3); asparagine/glutamine (+0.2); glycine (0); threonine (-0.4); proline (-0.5 ± 1);
30 alanine/histidine (-0.5); cysteine (-1.0); methionine (-1.3); valine (-1.5);
31 leucine/isoleucine (-1.8); tyrosine (-2.3); phenylalanine (-2.5); and tryptophan (-3.4).

1 It is understood that an amino acid can be substituted by another amino acid
2 having a similar hydrophilicity score and still result in a protein with similar biological
3 activity, i.e., still obtain a biologically functional protein. In making such changes, the
4 substitution of amino acids whose hydropathic indices are within ± 2 is preferred, those
5 within ± 1 are more preferred, and those within ± 0.5 are most preferred.

6 As outlined above, amino acid substitutions are therefore based on the relative
7 similarity of the amino acid side-chain substituents, for example, their hydrophobicity,
8 hydrophilicity, charge, size, and the like. Exemplary substitutions which take various of
9 the foregoing characteristics into consideration are well known to those of skill in the art
10 and include: arginine and lysine; glutamate and aspartate; serine and threonine; glutamine
11 and asparagine; and valine, leucine, and isoleucine. Changes which are not expected to
12 be advantageous may also be used if these resulted in functional patatin proteins.

13 Example 23: Production of patatin proteins and permuteins in plants

14 Plant Vectors

15 In plants, transformation vectors capable of introducing nucleic acid sequences
16 encoding patatin proteins and permuteins are easily designed, and generally contain one
17 or more nucleic acid coding sequences of interest under the transcriptional control of 5'
18 and 3' regulatory sequences. Such vectors generally comprise, operatively linked in
19 sequence in the 5' to 3' direction, a promoter sequence that directs the transcription of a
20 downstream heterologous structural nucleic acid sequence in a plant; optionally, a 5' non-
21 translated leader sequence; a nucleic acid sequence that encodes a protein of interest; and
22 a 3' non-translated region that encodes a polyadenylation signal which functions in plant
23 cells to cause the termination of transcription and the addition of polyadenylate
24 nucleotides to the 3' end of the mRNA encoding the protein. Plant transformation
25 vectors also generally contain a selectable marker. Typical 5'-3' regulatory sequences
26 include a transcription initiation start site, a ribosome binding site, an RNA processing
27 signal, a transcription termination site, and/or a polyadenylation signal. Vectors for plant
28 transformation have been reviewed in Rodriguez et al. (Vectors: A Survey of Molecular
29 Cloning Vectors and Their Uses, Butterworths, Boston., 1988), Glick et al. (Methods in
30 Plant Molecular Biology and Biotechnology, CRC Press, Boca Raton, Fla., 1993), and

1 Croy (Plant Molecular Biology Labfax, Hames and Rickwood (Eds.), BIOS Scientific
2 Publishers Limited, Oxford, UK., 1993).

3 Plant Promoters

4 Plant promoter sequences can be constitutive or inducible, environmentally- or
5 developmentally-regulated, or cell- or tissue-specific. Often-used constitutive promoters
6 include the CaMV 35S promoter (Odell, J.T. et al., *Nature* 313: 810-812, 1985), the
7 enhanced CaMV 35S promoter, the Figwort Mosaic Virus (FMV) promoter (Richins et
8 al., *Nucleic Acids Res.* 20: 8451-8466, 1987), the mannopine synthase (*mas*) promoter,
9 the nopaline synthase (*nos*) promoter, and the octopine synthase (*ocs*) promoter. Useful
10 inducible promoters include promoters induced by salicylic acid or polyacrylic acids (PR-
11 1, Williams, S. W. et al., *Biotechnology* 10: 540-543, 1992), induced by application of
12 safeners (substituted benzenesulfonamide herbicides, Hershey, H.P. and Stoner, T.D.,
13 *Plant Mol. Biol.* 17: 679-690, 1991), heat-shock promoters (Ou-Lee et al., *Proc. Natl.*
14 *Acad. Sci. U.S.A.* 83: 6815-6819, 1986; Ainley et al., *Plant Mol. Biol.* 14: 949-967,
15 1990), a nitrate-inducible promoter derived from the spinach nitrite reductase gene (Back
16 et al., *Plant Mol. Biol.* 17: 9-18, 1991), hormone-inducible promoters (Yamaguchi-
17 Shinozaki, K. et al., *Plant Mol. Biol.* 15: 905-912, 1990; Kares et al., *Plant Mol. Biol.* 15:
18 225-236, 1990), and light-inducible promoters associated with the small subunit of RuBP
19 carboxylase and LHCP gene families (Kuhlemeier et al., *Plant Cell* 1: 471, 1989;
20 Feinbaum, R.L. et al., *Mol. Gen. Genet.* 226: 449-456, 1991; Weisshaar, B. et al., *EMBO*
21 *J.* 10: 1777-1786, 1991; Lam, E. and Chua, N.H., *J. Biol. Chem.* 266: 17131-17135,
22 1990; Castresana, C. et al., *EMBO J.* 7: 1929-1936, 1988; Schulze-Lefert et al., *EMBO J.*
23 8: 651, 1989). Examples of useful tissue-specific, developmentally-regulated promoters
24 include the β -conglycinin 7S promoter (Doyle, J.J. et al., *J. Biol. Chem.* 261: 9228-9238,
25 1986; Slighton and Beachy, *Planta* 172: 356-363, 1987), and seed-specific promoters
26 (Knutzon, D.S. et al., *Proc. Natl. Acad. Sci. U.S.A.* 89: 2624-2628, 1992; Bustos, M.M. et
27 al., *EMBO J.* 10: 1469-1479, 1991; Lam and Chua, *Science* 248: 471, 1991; Stayton et
28 al., *Aust. J. Plant. Physiol.* 18: 507, 1991). Plant functional promoters useful for
29 preferential expression in seed plastids include those from plant storage protein genes and
30 from genes involved in fatty acid biosynthesis in oilseeds. Examples of such promoters

1 include the 5' regulatory regions from such genes as napin (Kridl et al., *Seed Sci. Res.* 1:
2 209-219, 1991), phaseolin, zein, soybean trypsin inhibitor, ACP, stearyl-ACP
3 desaturase, and oleosin. Seed-specific gene regulation is discussed in EP 0 255 378.
4 Promoter hybrids can also be constructed to enhance transcriptional activity (Comai, L.
5 and Moran, P.M., U.S. Patent No. 5,106,739, issued April 21, 1992), or to combine
6 desired transcriptional activity and tissue specificity.

7 Plant transformation and regeneration

8 A variety of different methods can be employed to introduce such vectors into
9 plant protoplasts, cells, callus tissue, leaf discs, meristems, etcetera, to generate
10 transgenic plants, including *Agrobacterium*-mediated transformation, particle gun
11 delivery, microinjection, electroporation, polyethylene glycol mediated protoplast
12 transformation, liposome-mediated transformation, etcetera (reviewed in Potrykus, I.
13 *Ann. Rev. Plant Physiol. Plant Mol. Biol.* 42: 205-225, 1991). In general, transgenic
14 plants comprising cells containing and expressing DNAs encoding patatin proteins and
15 permuteins can be produced by transforming plant cells with a DNA construct as
16 described above via any of the foregoing methods; selecting plant cells that have been
17 transformed on a selective medium; regenerating plant cells that have been transformed
18 to produce differentiated plants; and selecting a transformed plant which expresses the
19 protein-encoding nucleotide sequence.

20 Specific methods for transforming a wide variety of dicots and obtaining
21 transgenic plants are well documented in the literature (Gasser and Fraley, *Science* 244:
22 1293-1299, 1989; Fisk and Dandekar, *Scientia Horticulturae* 55: 5-36, 1993; Christou,
23 *Agro Food Industry Hi Tech*, p.17, 1994; and the references cited therein).

24 Successful transformation and plant regeneration have been reported in the
25 monocots as follows: asparagus (*Asparagus officinalis*; Bytebier et al., *Proc. Natl. Acad.*
26 *Sci. U.S.A.* 84: 5345-5349, 1987); barley (*Hordeum vulgare*; Wan and Lemaux, *Plant*
27 *Physiol.* 104: 37-48, 1994); maize (*Zea mays*; Rhodes, C.A. et al., *Science* 240: 204-207,
28 1988; Gordon-Kamm et al., *Plant Cell* 2: 603-618, 1990; Fromm, M.E. et al.,
29 *Bio/Technology* 8: 833-839, 1990; Koziel et al., *Bio/Technology* 11: 194-200, 1993); oats
30 (*Avena sativa*; Somers et al., *Bio/Technology* 10: 1589-1594, 1992); orchardgrass

1 (*Dactylis glomerata*; Horn et al., *Plant Cell Rep.* 7: 469-472, 1988); rice (*Oryza sativa*,
2 including indica and japonica varieties; Toriyama et al., *Bio/Technology* 6: 10, 1988;
3 Zhang et al., *Plant Cell Rep.* 7: 379-384, 1988; Luo and Wu, *Plant Mol. Biol. Rep.* 6:
4 165-174, 1988; Zhang and Wu, *Theor. Appl. Genet.* 76: 835-840, 1988; Christou et al.,
5 *Bio/Technology* 9: 957-962, 1991); rye (*Secale cereale*; De la Pena et al., *Nature* 325:
6 274-276, 1987); sorghum (*Sorghum bicolor*; Casas, A.M. et al., *Proc. Natl. Acad. Sci.*
7 *U.S.A.* 90: 11212-11216, 1993); sugar cane (*Saccharum* spp.; Bower and Birch, *Plant J.*
8 2: 409-416, 1992); tall fescue (*Festuca arundinacea*; Wang, Z.Y. et al., *Bio/Technology*
9 10: 691-696, 1992); turfgrass (*Agrostis palustris*; Zhong et al., *Plant Cell Rep.* 13: 1-6,
10 1993); wheat (*Triticum aestivum*; Vasil et al., *Bio/Technology* 10: 667-674, 1992; Weeks,
11 T. et al., *Plant Physiol.* 102: 1077-1084, 1993; Becker et al., *Plant J.* 5: 299-307, 1994),
12 and alfalfa (Masoud, S.A. et al., *Transgen. Res.* 5: 313, 1996); *Brassica* (canola/oilseed
13 rape) (Fry, J. *Plant Cell Rep.* 6: 321-325, 1987); and soybean (Hinchee, M. *Bio/Technol.*
14 6: 915-922, 1988).

15 All of the compositions and/or methods disclosed and claimed herein can be made
16 and executed without undue experimentation in light of the present disclosure. While the
17 compositions and methods of this invention have been described in terms of preferred
18 embodiments, it will be apparent to those of skill in the art that variations can be applied
19 to the compositions and/or methods and in the steps or in the sequence of steps of the
20 methods described herein without departing from the concept, spirit and scope of the
21 invention. More specifically, it will be apparent that certain agents which are both
22 chemically and physiologically related can be substituted for the agents described herein
23 while the same or similar results would be achieved. All such similar substitutes and
24 modifications apparent to those skilled in the art are deemed to be within the spirit, scope
25 and concept of the invention.
